HEELING MOMENTS

- 1) Heeling moment resulting from movement of passengers

$$M_{\text{passenger}} = (0.075 * N_p) * (0.45 * B) = 36.8565 \text{ [tm]}$$

Where,

N_p is the maximum number of passengers permitted to be on board in the service condition corresponding to the deepest subdivision draught under consideration
 $N_p = 60$

B is the beam of the ship = 18.2007 [m]

- 2) Moment of maximum assumed wind force acting in damage situation

$$M_{\text{wind}} = (P * A * Z) / 9.806 \text{ [tm]}$$

Where,

$$P = 120 \text{ N/m}^2$$

A = projected lateral area above waterline

Z = distance from centre of lateral projected area above waterline to $T/2$
and

T = ship's draught

M_{wind} moment is calculated by software automatically for every waterline condition

- 3) Maximum assumed heeling moment due to the launching of all fully loaded de-
launched survival craft on one side of the ship.

$$M_{\text{survivalcraft}} = 50 \text{ [tm]}$$
