Weekly report: Week 14 of dissertation for Uninett AS on authentication in IoT

by Magnus Bakke & Liang Zhu at Informatics with specialization in network administration at the Norwegian University of Science and Technology

Activities

Monday April 1

We added the “spinning wheel” to the frontend, as well as the final screen where the user is shown their password. The password is hidden at first, and the user is required to click a small button labeled “show password” in order to reveal it. The password can then be hidden again.

We will later implement a security feature that removes the password from the text box after a certain amount of time has passed.

Work on the execution report continued.

Tuesday April 2

We worked on the execution report.

Wednesday April 3

We added the security feature that removes the password from the text box after a number of minutes. We continued working on the execution report.
