ALDFG	Abandoned, Lost, or otherwise Discarded Fishing Gear
ASC	Aquaculture Stewardship Council
BPA	Bisphenol A
EA	Environmental Action (Research & Consultancy for Impact)
EEA	European Environment Agency
EPR	Extended Producer Responsibility
EPS	Expanded Polystyrene, also wrriten as 'PSE'
FFL	Fishing for Litter
FRs	Flame Retardants
GDP	Gross Domestic Product
GESAMP	Group of Experts on the Scientific Aspects of Marine Environmental Protection
HDPE	High Density Polyethylene
HMF	Norwegian Retailers' Environment Fund, 'Handelens Miljøfond' in Norwegian
IOA	Input-Output Analysis
IUCN	International Union for Conservation of Nature
LCA	Life Cycle Assessment
LCIA	Life Cycle Impact Assessment
LDPE	Low-density polyethylene
MFA	Material Flow Analysis
NIVA	Norwegian Institute for Water Research, 'Norsk institutt for vannforskning' in Norwegian
NP	Nonylphenol
PA	Polyamide
PE	Polyethylene
PET	Polyethylene Terephthalate
PP	Polypropylene
PS	Polystyrene
PVC	Polyvinyl Chloride
SR	Synthetic Rubber
SSB	Statistics Norway, 'Statistisk sentralbyrå' in Norwegian
US EPA	United States Environmental Protection Agency

Key definition

Hotspots	Refer to the most relevant plastic polymers, applications, industrial sectors, regions or waste management stages causing the leakage of plastics into the environment (including land, air, water and marine environment), as well as associated impacts, through the life cycle of plastic products.
Interventions	Are tangible actions that can be taken to mitigate hotspots and are to be prioritized and designed to address the most influential hotspots in the plastic value chain.
Instruments	Are ways an intervention may be practically implemented through specific regulatory, financial or informative measures, considering context factors such as country dynamics and existing measures. As an illustrative example, a country may identify "mismanaged polyethylene bottles" as one of its hotspots. A relevant intervention may be an increase in bottle collection rate. A relevant instrument may be to instate a bottle return deposit scheme.
Properly Disposed	Waste fraction that is disposed in a waste management system where no leakage is expected to occur, such as an incineration facility or a sanitary landfill. We define a sanitary landfill as a particular area where large quantities of waste are deliberately disposed in a controlled manner (e.g., waste being covered on a daily basis, as well as the bottom of the landfill designed in a way to prevent waste from leaching out). Landfilling is mainly the result of a formal collection sector.
Improperly Disposed	Waste fraction that is disposed in a waste management system where leakage is expected to occur, such as a dumpsite or an unsanitary landfill. A dumpsite is a particular area where large quantities of waste are deliberately disposed in an uncontrolled manner, and can be the result of both the formal and informal sectors. A landfill is considered as unsanitary when waste management quality standards are not met, thus entailing a potential for leakage.

Littering	Incorrect disposal of small, one-off items, such as: throwing a cigarette, dropping a crisp packet, or a drink cup. Most of the time these items end-up on the road or side-ways. They may or may not be collected by municipal street cleaning.
Uncollected	Waste fraction (including littering) that is not collected by the formal sector.
Domestic Waste	Waste generated within the country.
Mismanaged Waste	The sum of uncollected and improperly disposed waste. It is plastic that is prone to be released to the environment. The mismanaged waste index is the ratio of the mismanaged waste and the total waste. It is abbreviated as MWI and its value given in percentage.
Leakage	The plastic released to rivers and oceans. The leakage rate is ratio between leakage and total waste generated, and its value is given in percentage.
Release Rate	The ratio between leakage and total mismanaged waste, and its value is given in percentage.
Macro-Plastic	Large plastic waste readily visible and with dimensions larger than 5 mm, typically plastic packaging, plastic infrastructure or fishing nets.
Micro-Plastic	Small plastic particulates below 5 mm in size and above 1 mm. Two types of micro-plastics are contaminating the world's oceans: primary and secondary micro-plastics. In this study, we focus on primary micro-plastics which are plastics directly released into the environment in the form of small particulates.
Mass Balance	Mass balancing is a mathematical process aiming at equalizing inputs and outputs of a given material flow across a system boundary. In our case, inputs consist of domestic production and imports while outputs consist of exports, waste generation and increase of stock. A mass balance allows to check data consistency and helps reconcile different datasets when needed.

Formal Sector	Waste management activities planned, sponsored, financed, carried out or regulated and/or recognized by the local authorities or their agents, usually through contracts, licenses or concessions
Informal Sector	Individuals or a group of individuals who are involved in waste management activities, but are not formally registered or formally responsible for providing waste management services. Newly established formalized organizations of such individuals; for example, cooperatives, social enterprises and programs led by non-governmental organizations (NGOs), can also be considered as the informal sector for the purpose of this methodology.
Plastic Leakage	A quantity of plastic entering the oceans as well as other environmental compartments (e.g. rivers, soil, air).
Plastic Impact	A potential effect the leaked plastic may have on ecosystems and /or human health.

Acknowledgements

I would first like to express my gratitude to my master thesis advisors Dr. Francesca Verones and Dr. Karl Klingsheim from Industrial Ecology Programme of the Department of Energy and Process Engineering in Faculty of Engineering at Norwegian University of Science and Technology, who gave me constructive suggestions and inspirations whenever I ran into a trouble spot or had a question about my research or writing. They consistently allowed this paper to be my own work, but steered me in the right the direction whenever they thought I needed it.

In addition, I am grateful to myself. Along the way, never have I forgotten my love and passion for the environment and nature, nor have I broken my promise as a scuba diver to protect the marine ecosystem of our planet, which has always motivated me to devote myself to environment, ecology and sustainability studies.

Lastly, I must express my very profound gratitude to my parents and friends, providing me with unfailing support and continuous encouragement throughout my study and through the process of researching and writing this report. This accomplishment would never have been possible without them. Special thanks to Patrick Christian Bösch, who has always been my closest friend and gave me unconditional support and compassion during my most difficult moments.

Thank you!

Fei Song

2021.June.30th

Abstract

Plastic has been widely used in vast volume all over the world for decades, and the plastic waste has caused many environment problems globally, among which the leakage of plastic into the ocean has been particularly worrisome in recent years for its lasting impacts on ecosystems and humans. Although the attention on ocean plastics has been intensified, there has been a lack of a comprehensive, feasible, fixable and unified quantitative estimation and evaluation method.

In 2019, the National Guidance for Plastic Pollution Hotspotting and Shaping Action (hereinafter referred to as 'the Guidance') was co-developed by the International Union for Conservation of Nature (IUCN), The United Nations Environment Programme (UNEP) with technical support of Environmental Action (EA) and Quantis, which has been implemented in 7 pilots from 3 continents (status 2021 February), proving to be viable, adaptable and versatile.

In this thesis, based on the published pilot reports and the method designed by the Guidance, a cross-comparison of completed pilot country studies and a case study of Norway are conducted. The results show that a great number of leakage hotspots like packaging, tires and textiles occur universally in various pilot countries as well as in Norway, and management and control of these hotspots still needs to be strengthened purposefully in order to alleviate the ocean plastic crisis.

Table of Context

List of Tables

List of Figures

1. Introduction

1.1 Use and littering of plastics

The first synthetic plastic was produced by Alexander Parkes in 1862, when he invented celluloid, a material that could be shaped when heated and kept its shape when cooled (PlasticsEurope, 2021). Other innovations quickly followed, with heat resistance and flexibility, attracting a variety of industries such like packaging, textiles, construction and so on get into the plastics business (Science History Institute, 2016).

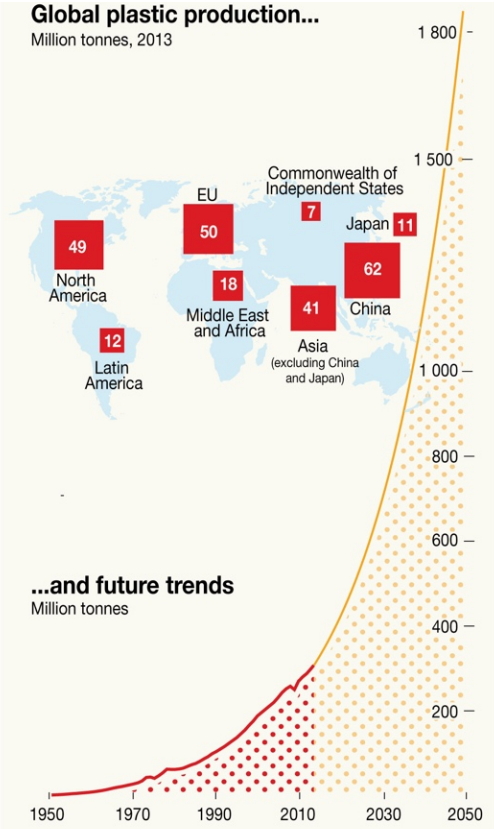

Figure 1.Global plastic production in 2013 and future trends (GRID-Arendal, 2018a)

Believed to be one of the most important industrial innovations in the modern world (Ombis, 2012), plastics can be deployed to many thanks to their nature of being cheap, easy-to-obtain, durable, shapeable, and low-density, which consequently turns themselves a material with incomparable advantages. Coupled with the modern prevailing model of economic development that relies heavily on uninterrupted flow of materials (EEA, 2019), the level of plastic production and consumption has risen continually because of the market demand (Figure 1). In 2015, the cumulative global plastics production of polymer resin and fiber

counting from 1950 reached 7.82 billion tones (Geyer et al., 2017), and the increasing trend is projected to continue its expansion in the future.

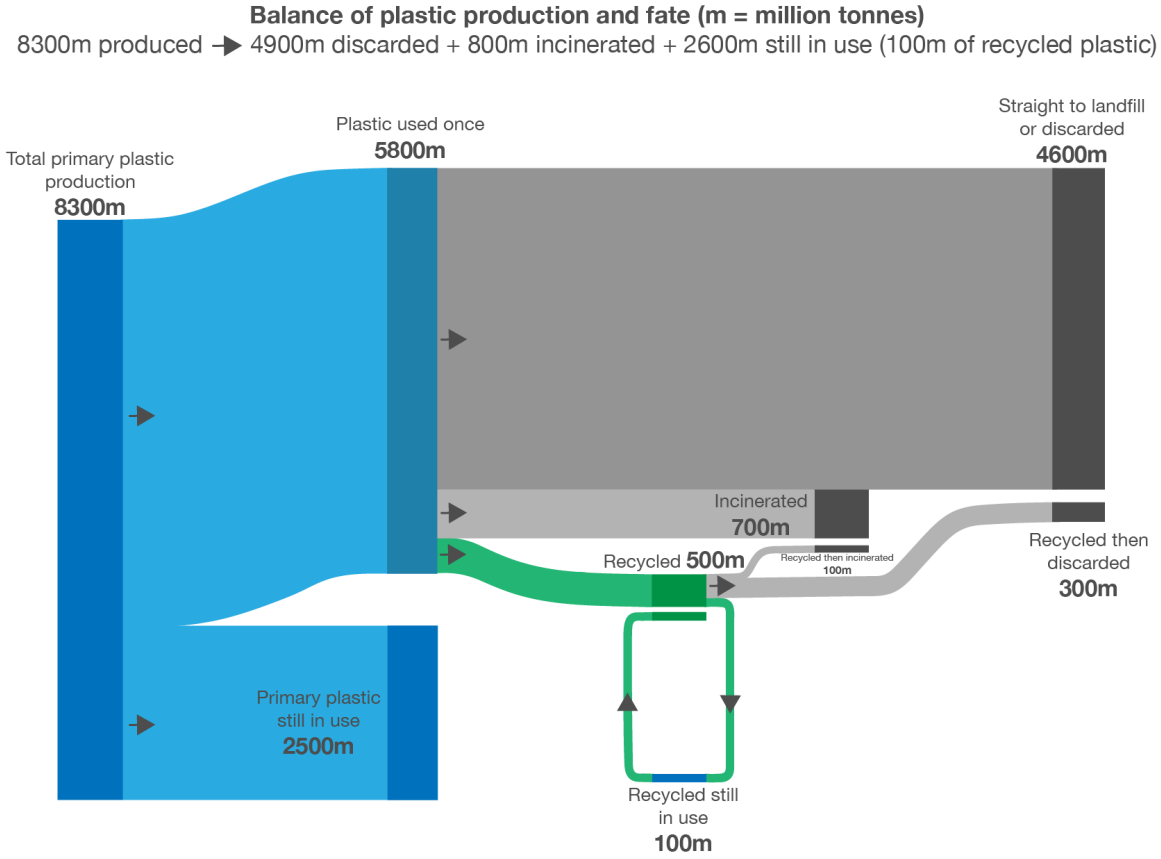

Figure 2 Fate of plastics production of polymers, fibers and additives from 1950 to 2015(Scarr & Hernandez, 2019)

Just like the life-cycle of many other materials, plastics also follow the pattern of extraction, production, consumption and waste generation (EEA, 2020). The vast majority of plastics having shown in human society turns into waste after being used/consumed, around 60% of total plastics produced during the period from 1950 to 2015 went to landfill or were discarded (Figure 2). Although in the past decades, with the increasingly urgent calling for solution to environmental problems and people's awareness of environmental protection, the recovery rate of plastics is rising, landfill and discarded are still seen as the predominant fate for plastic waste despite of the incineration and recycling rate have been increasing (Figure 3).

The inappropriate disposal of plastic waste has a long history and has become a problem that is both ubiquitous and worrying. In many developing countries, improper plastic waste treatment is particularly prevalent, as a result, the volume of plastic emission to ocean is worryingly high (Figure 5), while in most developed countries it is less troublesome (Lebreton & Andrady, 2019). Improper and unregulated disposal practices, inadequate waste

management infrastructure, and the use of insufficient recycling technology, combined with a lack of public awareness and government incentives, have made plastic waste pervasive in environment of many developing countries (Hahladakis, 2020), littering both the aquatic and terrestrial ecosystem with a variety of impacts (Figure 4).

Figure 5 Improperly disposed rate and emssion to ocean (Ritchie & Roser, 2018)

1.2 Ocean plastic debris

As discarded plastic can be transported by wind, tide and inland waterways (Figure 6), around 3% of global annual plastics waste eventually enters the oceans (Jambeck et al., 2015), making ocean plastic debris an emerging concern worldwide, which accounts for 80% of all marine debris ranging from surface waters to deep-sea sediments (IUCN, 2018). In 2010, it is estimated that 4.8 million to 12.7 million tons of plastics have been discarded into the Oceans (Lusher et al., 2017).

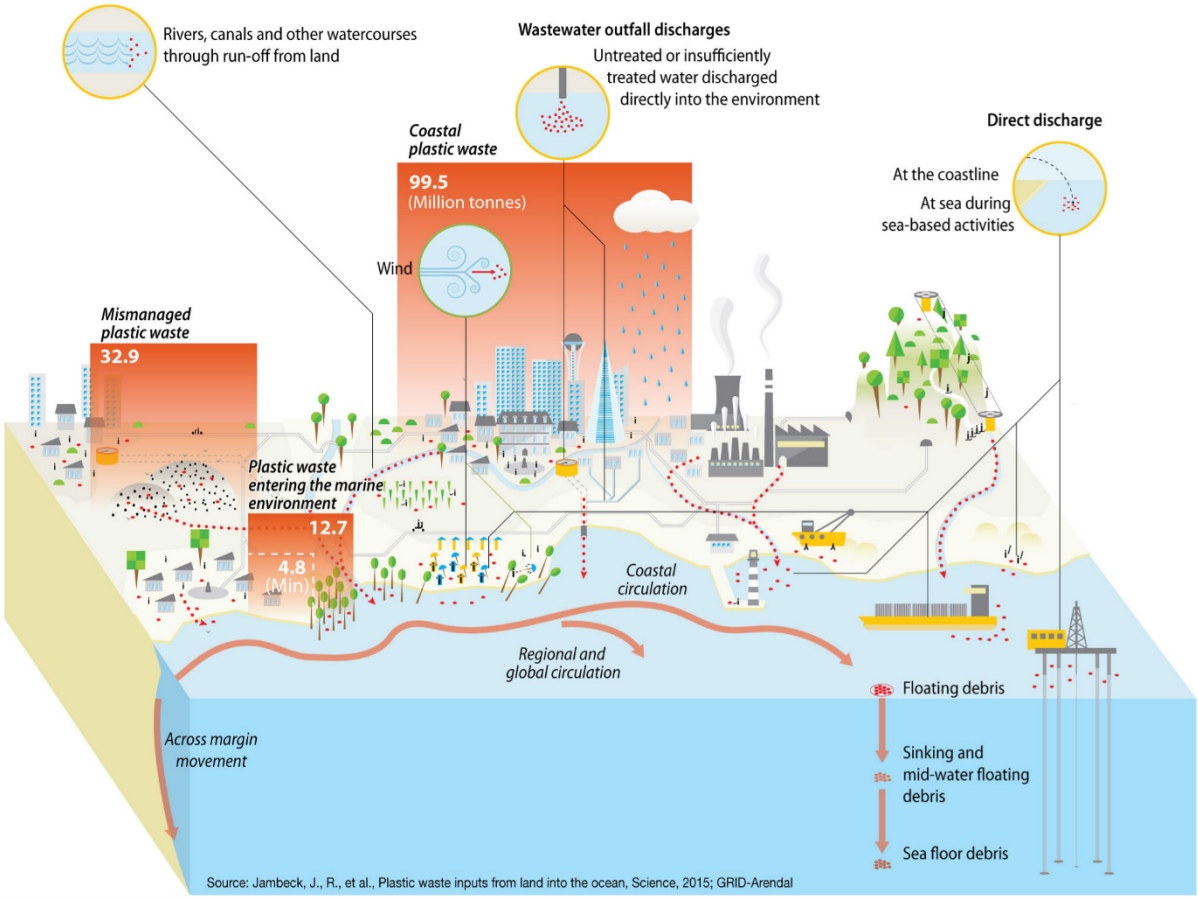

Figure 6 Pathway of plastics entering the oceans (Jambeck et al., 2015)

Plastic debris has been found in all ocean regions (Emmerik & Schwarz, 2020) and at every depth ranging from 5 to 1000 m (Choy et al., 2019). Besides, the fraction of plastic particles floating on the ocean surface could be in trillions (Lebreton et al., 2018), weighting approximately 270 kt (Figure 7), which only accounts 0.5% of all plastics in the oceans in mass (Figure 8). The overall amount of plastic that will ultimately reach the ocean is expected to increase by an order of magnitude by 2025. (Rochman, 2016)

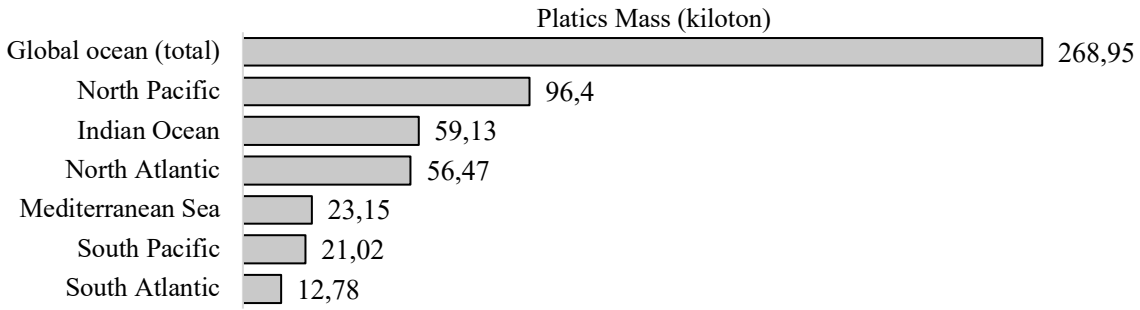

Figure 7 Surface floating plastic by ocean basin in 2013 (Eriksen et al., 2014)

We cannot neglect the effects of ocean plastic debris on marine ecosystem. Sea life that ingests or becomes entangled in plastic waste suffers serious injuries and even death, putting marine animals at risk and thereby reducing biodiversity (Derraik, 2002; Gall & Thompson, 2015; Gregory, 2009; McKinney, 1998). The interactions of plastic debris with marine systems include obstructions, abrasions, collisions, or use as substrate (Ritchie & Roser, 2018)., which can alter coastal ecosystems (for example, when plastic of fishing gear collides with coral reef, it causes abrasion and damage), impacting light penetration, organic matter access, and oxygen exchange ability, resulting in low habitability (Beaumont et al., 2019; Goldberg, 1997; Mendenhall, 2018; Ritchie & Roser, 2018), accelerating the degradation of ecosystems (Alagarsamy et al., 2014).

Not only marine ecosystems can be affected, plastic debris can also impact humans (Keswani et al., 2016). Plastic waste consumed by marine animals may ultimately make its way to our dinner tables, posing a health risk to humans (Derraik, 2002). In addition to the potential direct harm of plastic debris such like wound cuts by the sharp edges and infection by bacteria attached (Beaumont et al., 2019), the released chemicals derived from plastics and their additives such as persistent organic pollutants (POPs), and other Substance of Concern (SoC) have the potential to adversely affect human health.

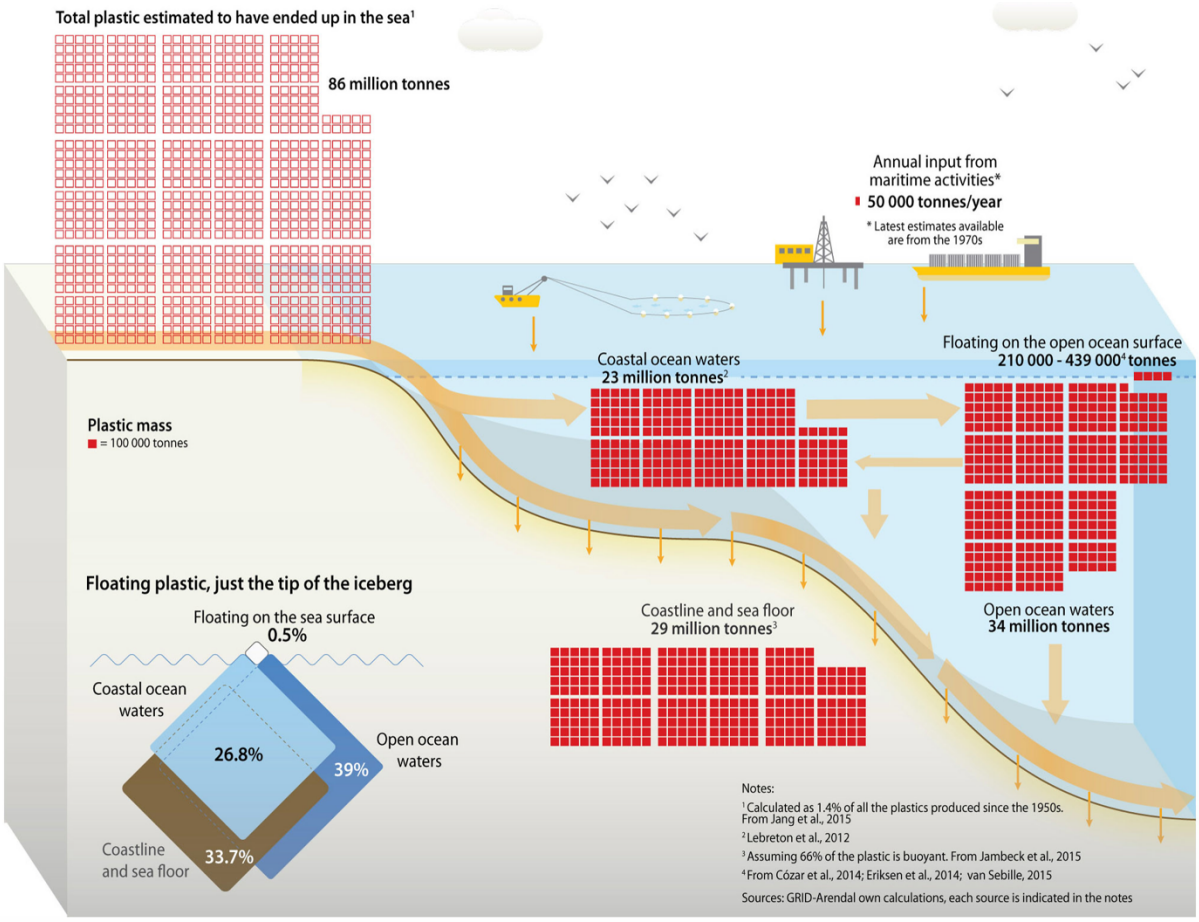

Figure 8 Ocean plastic debris and its distribution (GRID-Arendal, 2018b)

1.3 Previous studies

The condition of marine plastics has been significantly exposed in recent years, with the awakening and increase of public environmental consciousness. In this field, more and more institutions and scholars participate, and the breadth and depth of the researches are keeping improving (Figure 9). Jambeck et al have the most up-to-date figures of global plastic waste inputs into the oceans from land-based sources (Jambeck et al., 2015). However, some assumptions were made in this research, and it is thought that the calculations given therein may be an underestimation of truth (Horton et al., 2017). Schwarz et al. identified the key sources, transport, and accumulation of different forms of plastics in various aquatic environments in a comprehensive analysis (Schwarz et al., 2019).

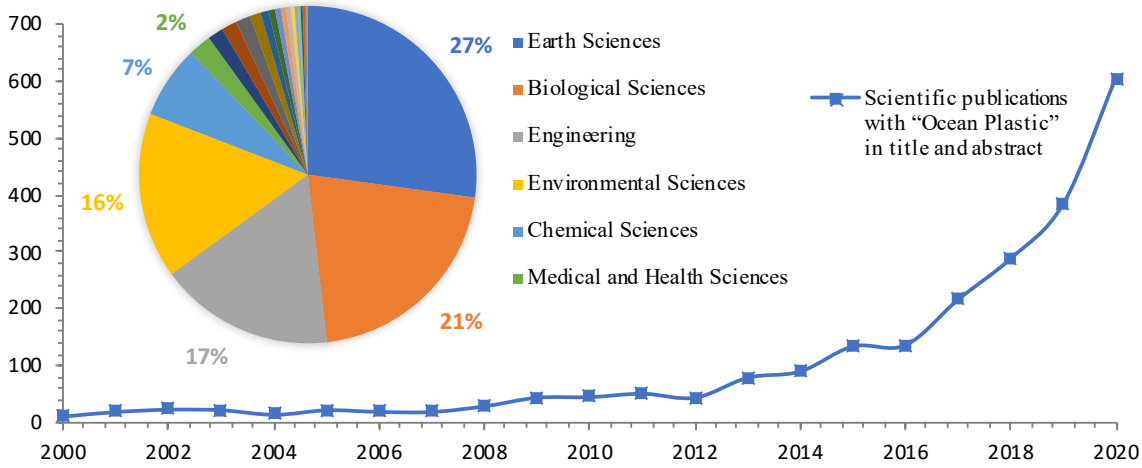

Figure 9 Research trend and fields of ocean plastic (Dimensions, 2021)

Although the issue of marine plastic debris has received more and more attention from society and academia, some factors, such as (1) the lack of reliable data, (2) the complexities of the plastics production-generation waste system, (3) global differences in societal attitudes and waste management infrastructure, (4) the uncertainty of marine and terrestrial ecosystem interactions and (5) numerous sources of plastics leakage (Dahlbo et al., 2018; Hahladakis, 2020; Hahladakis et al., 2018; Hahladakis & Aljabri, 2019; Horton et al., 2017; Mahon et al., 2017; Rillig, 2012; Scholz-Lechner & Ramler, 2015; Talvitie et al., 2017), have rendered the of the fluxes estimation and sources identification of plastic leakage extremely challenging tasks.

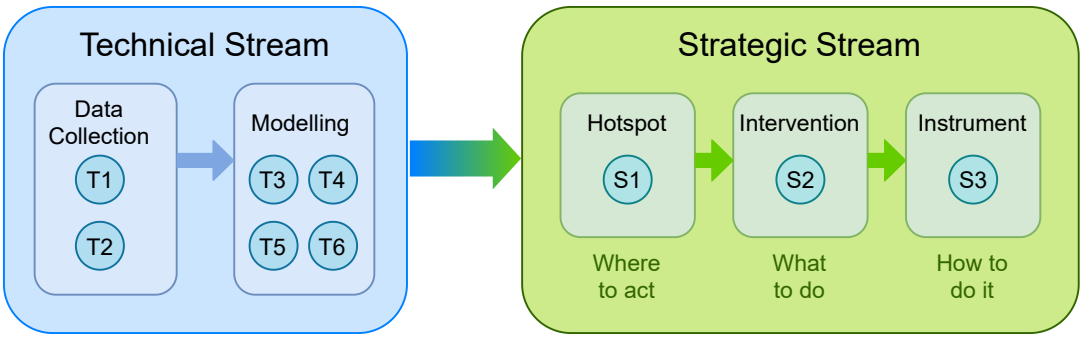

Figure 10 Workflow of the Guidance

To provide an actionable, systemic and holistic method of hotspotting plastics flows and origins, in 2019, the *National Guidance for Plastic Pollution Hotspotting and Shaping Action* (hereinafter referred to as 'the Guidance') was co-developed by the International Union for Conservation of Nature (IUCN), The United Nations Environment Programme (UNEP)

with technical support of Shaping Environmental Action (EA) and Quantis, which offers a comprehensive perspective into the measurement of plastic leakage sources. The schemes of guidance can be divided into technical stream and strategic stream (Figure 10), which specialize in the research with analytical aspects and decision-making support to relevant stakeholders respectively.

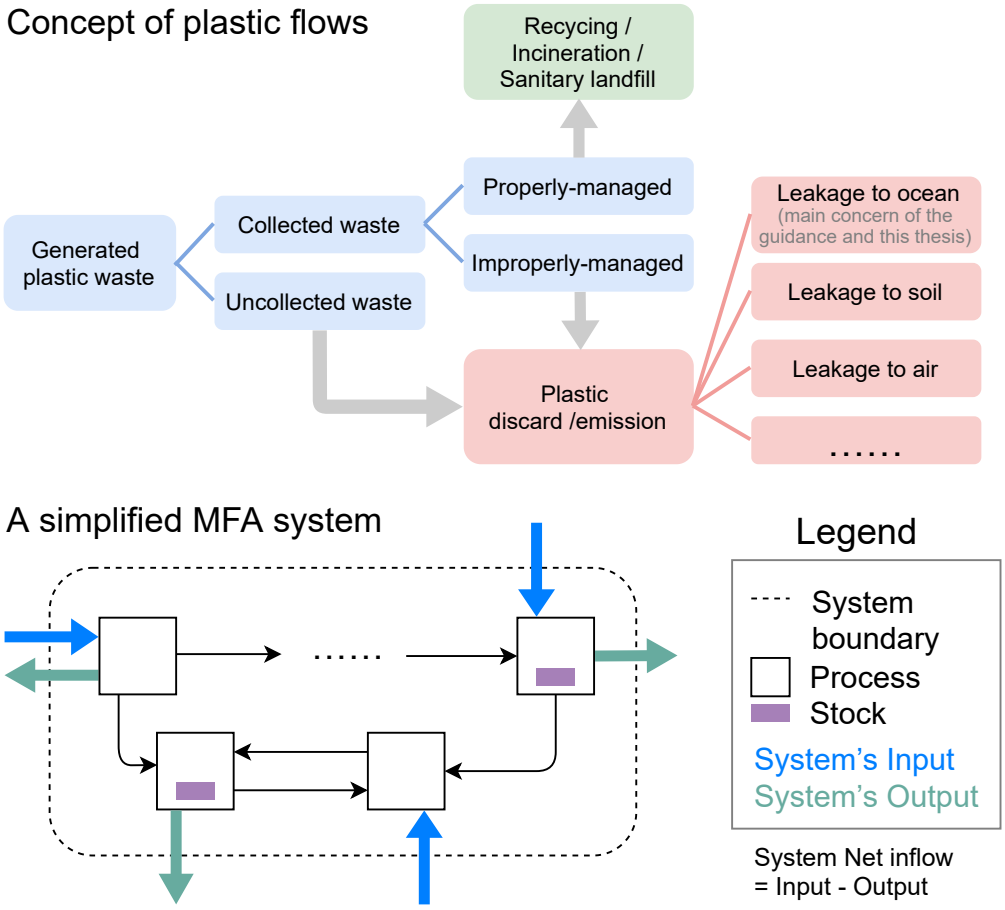

Figure 11 The concept shown in the Guidance and this thesis

By 2021 February, 7 countries/areas (Vietnam, Thailand, South Africa, Kenya, Mozambique, Menorca of Spain, and Cyprus) have implemented the Guidance with data of 2018 and published their reports as pilots (Table 1). African, Asian and European pilots are shadowed in blue, yellow and orange respectively in this table, the same hereinafter. More detailed information on the Guidance's method and reports' results is given in the second Chapter of this thesis.

◉ Assessed ◉ Not assessed

1.4 Aim and scope

Despite the importance of monitoring ocean plastic leakage, there is a lack of tools for the volume estimation of plastic leakage on both a global and Norwegian basis; furthermore, the sources of plastic debris are not fully acknowledged and identified. In this thesis, the framework and method of the Guidance is being studied, where the technical stream is the center of attention (Figure 10). The strategic stream is outside of the range of this thesis. Hotspots results from pilot reports published before 2021 February under the Guidance are investigated and compared. Pilots reports released afterwards are not covered in this thesis.

Under the Norwegian context, the data discrepancy between the Guidance ‘s demand and information available in Norway are described. The possibility and feasibility of applying this guidance is assessed and ranked, highly-feasible models of technical streams are run with data collected from government, organization reports and academic studies. The plastic leakage fluxes are estimated and their sources are hotspotted to assistant potential action shaping in the future. In the end, the limitations and outlooks of the Guidance and work in this thesis are discussed.

This thesis is aimed towards scientific audiences with basic university level knowledge of environment, ecology and waste treatment.

2. The Guidance and hotspotting approach

To assist countries and cities that are struggling with a critical information gap regarding the plastics leakage issue, in 2019, IUCN, EA, and Quantis collaborated on the development of *the National Guidance for Plastic Pollution Hotspotting and Shaping Action* , which offers an analytical structure as well as realistic methods that can be used at various geographical scales.

Aiming to help users find the most important hotspots in different situations with updated data and analysis, the Guidance can identify solutions to address a country's or city's current and/or urgent needs. The method presented in the Guidance allows for the monitoring of plastic use in a variety of fields, including healthcare, agriculture and food, logistics and transportation, and households, in order to establish strategies to mitigate the negative effects. Other than that, with the method of martial flow analysis (MFA) and principle of mass balance, some flows that are difficult to measure or estimate directly in previous surveys also become possible to quantify.

The Guidance also serves as a useful link between scientifically-based evaluations and policymaking. The Guidance's foundation is built on collecting and analyzing relevant data on plastic production, consumption, waste management, and disposal, as well as prioritizing hotspots, to map plastic leakage and its impacts across the value chain. The Guidance empowers governments to recognize and enforce appropriate strategies and instruments in cooperation with key stakeholders to resolve the identified hotspots. Decision-makers at national, sub-national or local levels can set goals, negotiate on and implement action plans, and track progress once they have credible information about their current situation using the Guidance.

2.1 Framework of the national Guidance

The Guidance consists of a set of nine modules that are divided in a technical stream (modules T1 to T6) and a strategic stream (modules S1 to S3), which specialize in the research with analytical aspects and decision-making support to relevant stakeholders respectively (Figure 10).

The conduction of technical stream starts with data-collection and completion of Module T1 (Plastic Inputs and Outputs) and T2 (Waste management), then other technical modules related to leakage and impacts T3 (polymer/application/sector hotspots), T4 (waste management hotspots), T5 (Regional hotspots) and T6 (Impacts) are performed.

Once the technical stream is completed, the strategic stream comes into the picture. After prioritizing hotspots and the key areas of intervention employing S1 and S2, the instrument alignment (S3) is deployed to support the planning and proposed implementation of the selected interventions through a guided process intended to help the relevant actors to converge on appropriate instruments and eventually take actions.

2.2 Models and tools

Different stream is equipped with different modules, each module is either a single tool or multiple tools combined as a kit. Technical modules concentrate on the generation of hot-spot knowledge (Figure 12, Table 2), while Strategic modules concentrate on creating interventions and instruments by engaging a larger community of stakeholders.

As the building blocks of the Guidance, all tools fall in 3 categories:

- Input tools (for data collection)
- Assessment tools (to generate hotspots, measures, and instruments)
- Output tools (to have summarized and shareable)

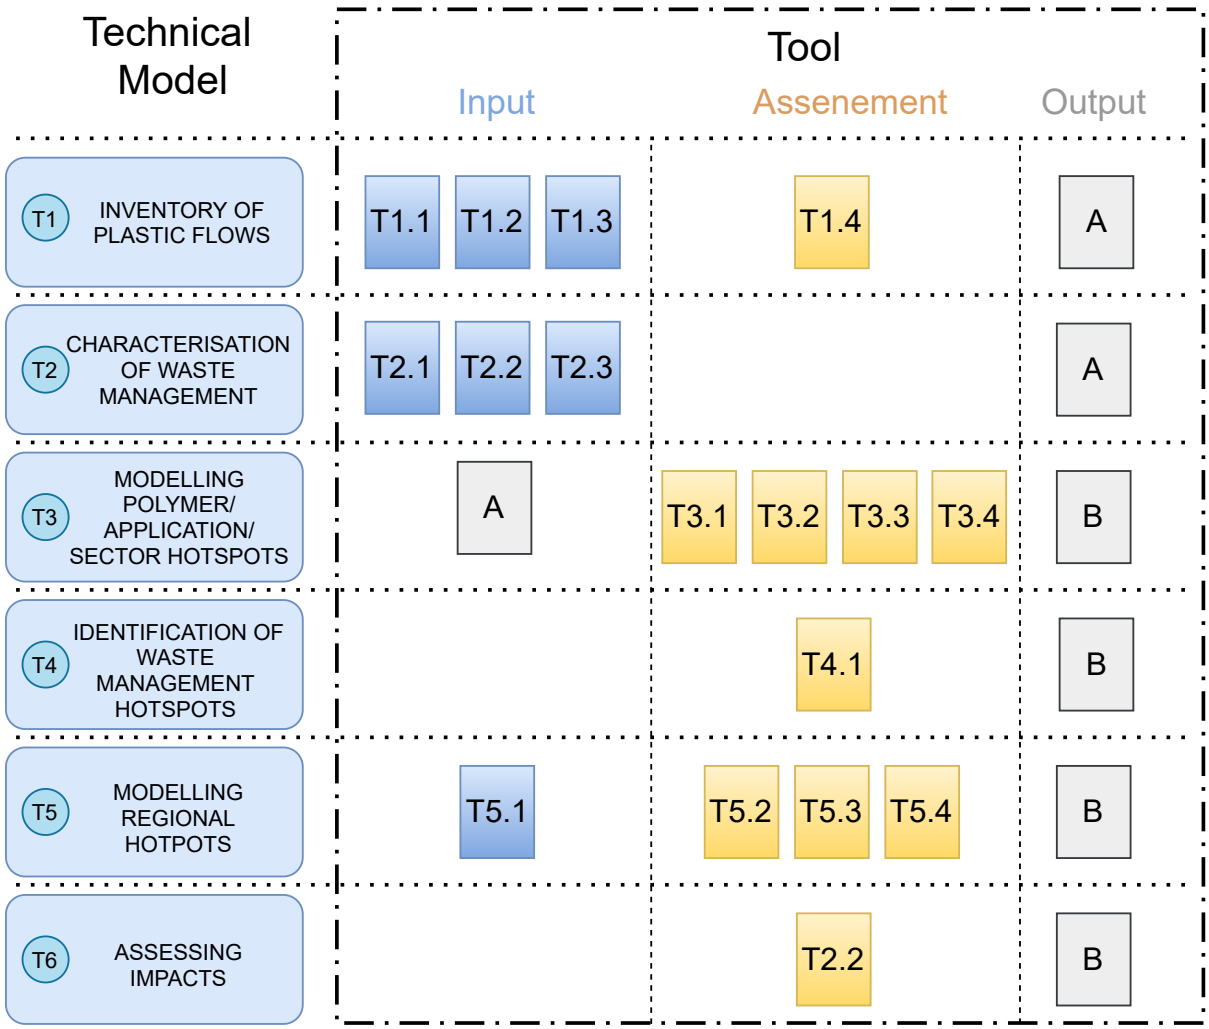

Figure 12 Technical models and related tools

Table 2 Object of tools in technical stream

Tool	Name	Type	Function
T1.1	Inventory of data sources and data gaps (plastic sources)	Input	List data sources and identify data gaps on plastic flows
T1.2	Data collection template (plastic sources)	Input	Support data collection on topics related to domestic plastic use and plastic flows
T1.3	Fisheries model canvas	Input	Support data collection on topics related to fishing activities
T1.4	COMTRADE data extraction	Assessment	Extract and organise relevant figures from COMTRADE database to be used in the modelling process
T2.1	Inventory of data sources and data gaps (waste management practices)	Input	List data sources and identify data gaps on waste management
T2.2	Data collection template (waste management practices)	Input	Support quantitative data collection on topics related to waste management at country level (waste collection, plastic waste recycling. etc.)
T2.3	Waste model canvas	Input	Canvas for guiding interviews with municipalities or waste management organisation (waste collection, plastic waste recycling, etc.)
T3.1	Fisheries leakage calculation	Assessment	Estimate plastic weights by type of fishing gear and calculate plastic leakage from the fishing sector
T3.2	Polymer/application/sector MFA & leakage calculation	Assessment	Compute mass balance and plastic leakage for polymer/application/sector hotspots categories
T3.3	MFA modelling quality assessment	Assessment	Assess the quality of hotspot results based on source reliability and modelling criteria
T3.4	Hotspot prioritisation canvas	Assessment	Prioritise hotspots based on absolute leakage quantities as well as relative leakage rates
T4.1	Waste management hotspot canvas	Assessment	Build a waste management dashboard highlighting components of the waste management system that contributes either positively or negatively to plastic leakage mitigation
T5.1	GIS model	Assessment	Provide the user with a pre-computed GIS model to facilitate the generation of relevant maps as an illustration of geographical results
T5.2	GIS modelling quality assessment	Assessment	Assess the quality of hotspot results based on source reliability and modelling criteria
T6.1	Plastic application impact assessment	Assessment	Impact assessment of plastic applications, to complement the analysis in Module T3
A	Domestic plastic data repository	Output	Gather all relevant data from T1 and T2as an input to the following modules for modelling and assessment
B	Summary of hotspots per category	Output	Summarise all hotspots by category resulting from Module T3 to T6

2.3 Pilot report

By the 28th of February 2021, 7 countries/regions (Vietnam, Thailand, South Africa, Kenya, Mozambique, Menorca of Spain, and Cyprus) have completed the national guidance and published their pilot report online (IUCN et al., 2020a, 2020b, 2020a, 2020c, 2020e, 2020f, 2020d). Participants are located on the coastline of Africa, Asia and Europe.

All the reports are structured in the same way (Figure 13), among all the Chapters presented in the report, 2nd , 3rd and 4th Chapters are the most country / region oriented.

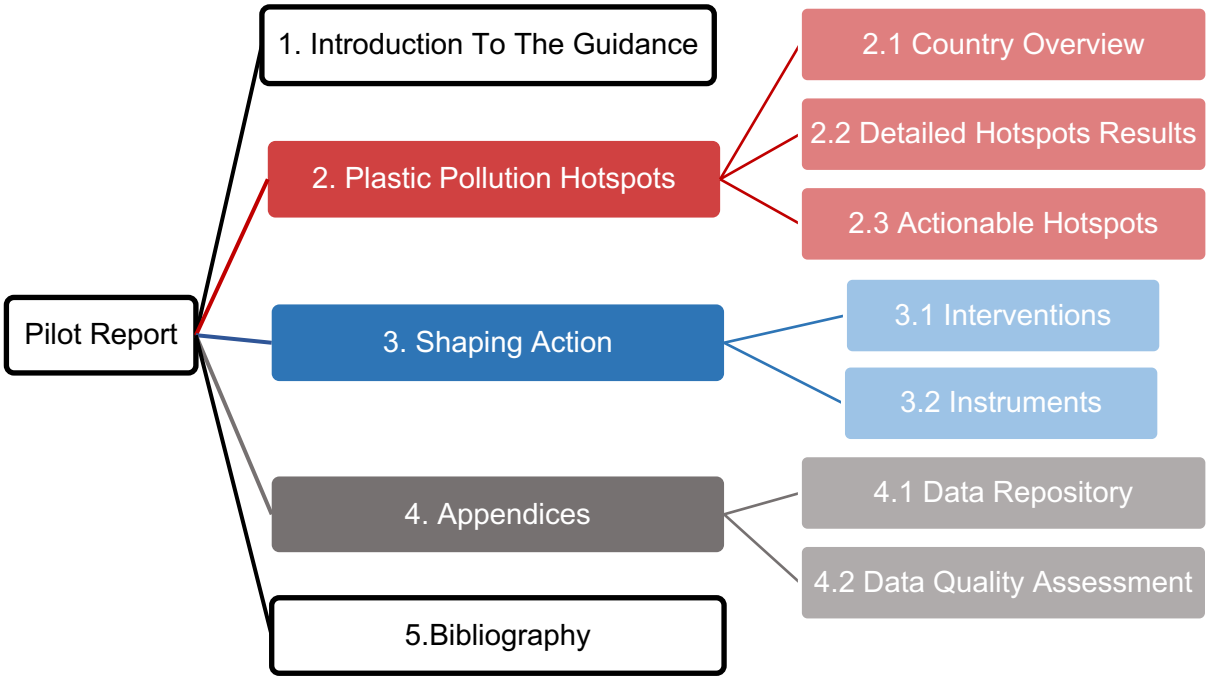

Figure 13 The pilot report structure.

3.Method

3.1. Hotspots comparison of the pilots

The comparison of the completed pilot projects is the first focus of this thesis. Reports from pilot countries published before 2021 Feb 28th were downloaded from the website of the national guidance project (https://plastichotspotting.lifecycleinitiative.org/pilots/). All reports published are structured in the same way as mentioned in the previous chapter: the 1st chapter of introduction to the Guidance, 2nd chapter of plastic pollution hotspots, and the 3rd chapter of shaping action.

As for this thesis, the 2nd chapter is of greatest interest.Primarily, the subchapter of 2.1 and 2.2 in the pilot reports about country overview and detailed hotspots results, are investigated. In this thesis, 5 hotspot categories presented in reports are sorted into quantitative ones (application, polymers, sectors) and qualitative ones (regional, waste management) in accordance with the form of the results presenting: quantitative ones are expressed in form of numbers while the qualitative ones are descriptive and conceptual (Table 3).

Tables and figures have been created to better present the processes and findings of this thesis. Unless otherwise specified, all figures and tables without citation in this thesis are the author's original work.

Table 3 Hotspots categories

Quantitative			Qualitative	
Polymer	Application	Sector	Waste Management	Region
PET	Other bottles	Packaging	Different elements of the waste managemnt system, such like "Value of recycled plastics", "Segregation of compostable waste", and so on.	City, district, sub-district level
PP	Other packaging	Agriculture		
Polyster	Lids and caps	Textiles		
LDPE	Dairy packing	Construction		
HDPE	Bags	Tourism		
PS	Baby diapers	Fishing		
Other	Drinke bottles	Medical		
Synthetic Rubber	Boxes,cases, crates	Electrical & Electronics		
PVC	Cigarette filters	Others		
	Sanitray towels	Automotive		
	Fishing nets	Transportation		

Individual pilot country's data is extracted from their own report and merged with other pilot countries for comparison in this thesis. Quantitative ones are kept to the same dimensioned tables, while qualitative ones are recorded into lists by the level of their assessment.

Visualization of data is derived after data gathering and interpretations are developed to better understand the different behaviors of pilot countries.

3.2. Case study in Norway

The second main focus of this study is to explore the applicability of this guidance to a Norwegian context. As the main object for this study, the technical stream (model T1 to T6) network is constructed with the instruction of models and tools provided by the Guidance (https://plastichotspotting.lifecycleinitiative.org/modules/), where input and output relation of each model are presented (Figure 14).

The next step is inventory data collection based on data input demand shown in Figure 1. Starting from T1 and T2, the input data demand is further identified with aspects of plastic sources, waste management, leakage, EPR policy, and GIS information. The data search first takes place in published articles and theses related to Norway, the list of stakeholders (environment organization, industry association, research institutes…) is also being completed during this process. The topic-related reports issued by stakeholders are gathered to further fulfill input data demand; some stakeholders are also contacted for interviews on technical support and information support (Table 4).

Table 4 Key stakeholders

Stakeholders	Information support	Technical support
Grønt Punkt Norway	√	
SSB - Statistics Norway	√	
Mepex Consult	√	
Hold Norge Rent	√	
HMF - Handelens Miljøfond	√	
Infinitum	√	
Salt Lofoten AS	√	
PlasticsEurope	√	
EA - Environmental Action		√
PLASTEAX	√	

To keep the consistency with pilots of the Guidance, the Norwegian data from 2018 is prioritized. In the case of unavailable data, assuming that the difference between years can be ignored, the data of other years are temporarily adopted.

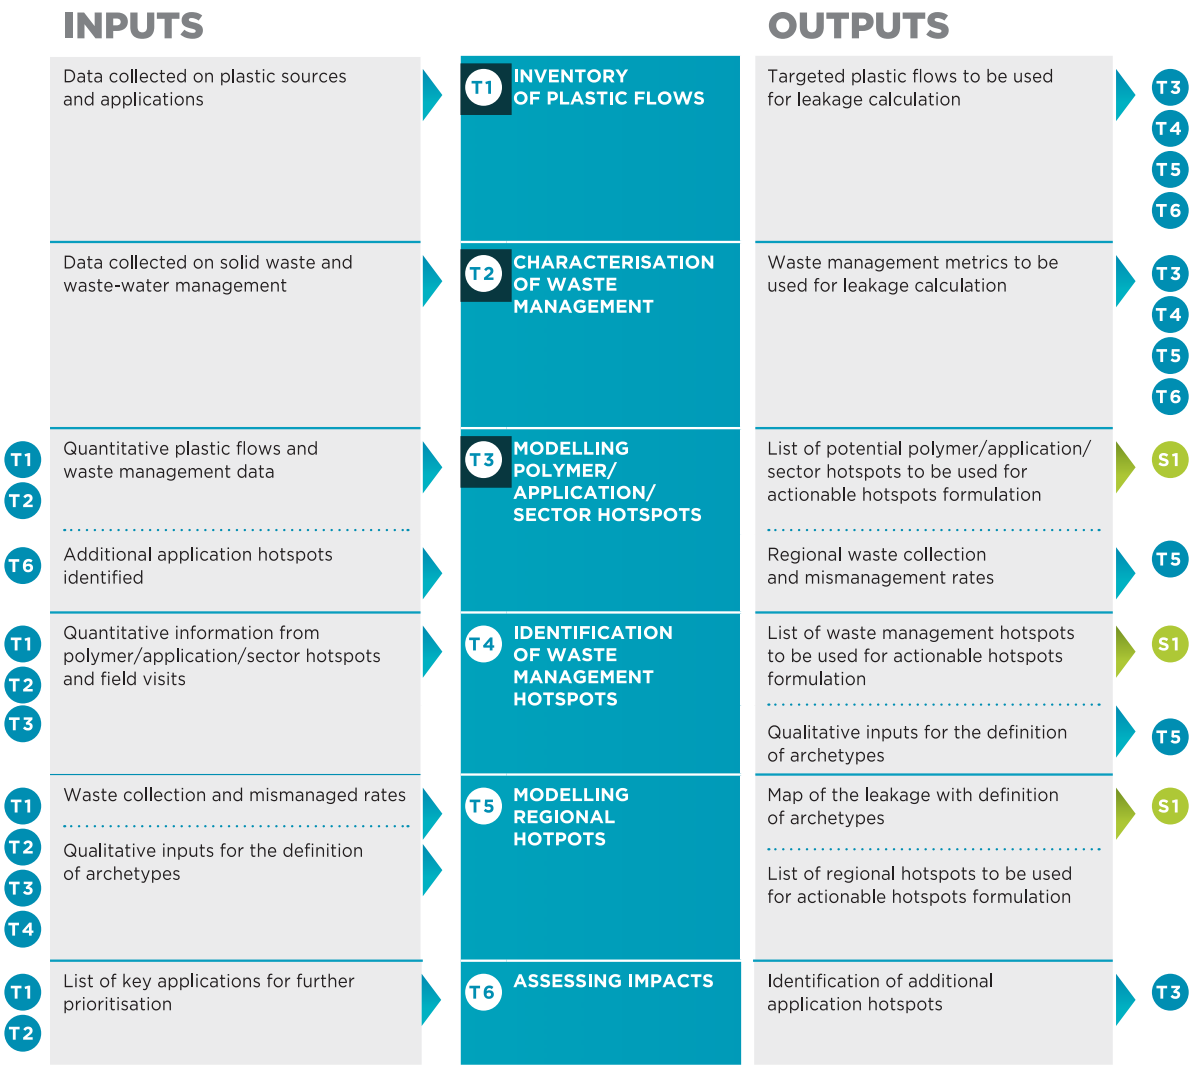

Figure 14 Technical stream network (IUCN et al., 2020b)

After preliminary data collection, the data gaps are identified and evaluated on the scale. For each technical model from T1 to T6, the feasibility of model-operation is being assessed with data input demand and data gap. The models are ranked by the order of feasibility, high-feasible ones are chosen to function under the Guidance instruction in the Norwegian context (Figure 15); while the low-feasible ones are recognized and the limiting factors are elaborated for future completion.

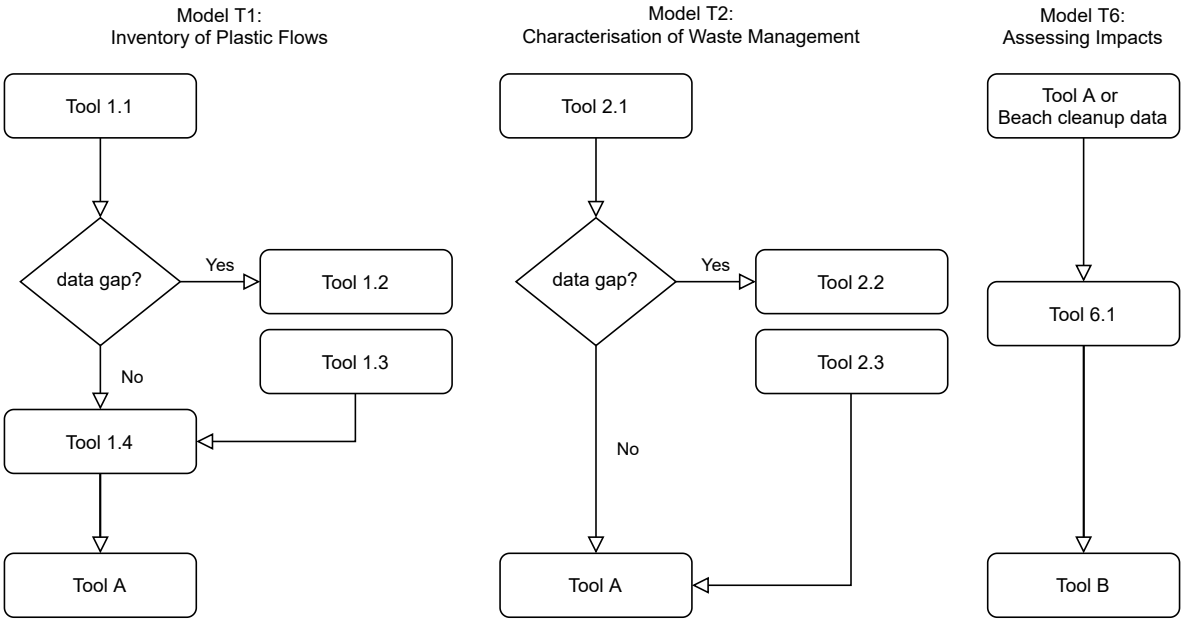

Figure 15 Flowchart of present highly feasible models

The results generated from highly feasible models using Norwegian data are compared with pilot countries to produce transferable lessons and references to policymakers and scientists.

4. Results and discussion

This chapter is divided into two parts:

1) comparison of the results of the already existing pilot projects.

2) The initial results from the Guidance's modules are displayed and interpreted for Norway, and the results are compared to other studies carried out in a Norwegian context.

4.1 Pilot project

Pilots are compared by the dimension of overview and specific hotspotting categories.

4.1.1 Overview

Subchapter 2.1 of pilot reports highlight on the general overview of plastic flows in each country/ region (Table 5), which involve both input and output of the national/regional plastic material system.

As the reports state absolute values, the internal and external interaction of the plastics flows of the pilot system are depicted by volume. Despite the high recycling mass, the absolute leakage in the Asian pilots is significantly larger than that in the others, suggesting that the Asian countries has the potential to play a crucial role in global efforts of solving the ocean plastic leakage. Although the European pilots reported the smallest absolute value of leakage, one cannot conclude that European countries have successfully responded to plastic leakage: on the one hand, the population of these two pilots is relatively small; on the other hand, their economic and industrial structure is significantly different from that of other pilots since they are recognized as developed counties, and even within the developed countries group, each one is impossible to behave the exactly the same.

In addition to most concerning item of leakage (the 2nd last column of the first part in Table 5), it is worth to point out that the overview in Table 5 also reveals the various plastic flow structure of each pilot, which is closely associated with their economic structures and outputs. For instance, Kenya, Mozambique and South Africa have significantly dissimilar orders of magnitude on the term "Export of primary and products", compared with the volume of "Import of primary and products", the difference indicates the amount used domestically, which suggests that the countries' plastic trade activities are happening at very different scales. The heterogeneity between pilots is thus reflected here.

Table 5 Pilots Overview

All plastic flows in the country

Continent	**Pilot**	Waste import (kt/year)	Product import (kt/year)	Import of primary and products (kt/year)	**Total input component* (kt/year)**	Export of primary and products (kt/year)	Change in stock (kt/year)	Waste export (kt/year)	Recycling (kt/year)	Properly disposed (kt/year)	Improperly disposed (kt/year)	Uncollected (kt/year)	Leakage (kt/year)	**Total output component ** (kt/year)**

	Menorca (Spain)	10,22	0	**10,22**

***Total waste = Waste export + Recycling + Properly disposed + Uncollected + Leakage = Domestic + Imported

However, the findings of the pilot reports focus on the absolute values in statistics, that fail to take into account that the size, population and the plastic consumption pattern of the pilot country/region would affect those values. To provide another perspective of this general picture, a plastic management analysis of pilot countries with more relative indicators provided by PLASTEAX is introduced (Table 6), including the leakage per capital per year. As part of Spain, Menorca Island's data is not available, so alternatively the data from the country level is adopted assuming that within the same country the regional difference can be neglected. Although Norway is not a pilot yet, its data are extracted from PLASTEAX considering the fact that it is compared with other pilots in this thesis. South Africa has the highest collection rate and recycle rate of collected plastics waste in developing countries, which suggests its outstanding performance in waste collection, whose system and policies is likely to be more transferable to developing countries. In terms of per capita plastic leakage, the value of two Asian pilots is dramatically higher than that of other countries, indicating that the plastic leakage situation in Asia may have been severely underestimated in the past.

Table 6 Pilot country plastic management in the PLASTEAX database(PLASTEAX, 2021)

Country/ region	Total plastic waste generation (kt/year)	Packaging waste generation (kt/year)	Collection rate	Recycling rate of the collected	Recycling rate including imports	Export for recycling	Plastic leakage per capita (kg/year)
South Africa	2371	1093	70%	14%	15%	0%	1,8
Kenya	502	201	27%	7%	7%	1%	0,8
Mozambique	179	115	29%	0%	1%	0%	0,5
Vietnam	5569	3071	36%	6%	15%	0%	4,7

Spain*	1814	1814	100%	20%	n.a	n.a	n.a
Cyprus	93	32	93%	0%	0%	11%	0,9
Norway*	540**	49	99%	31%	n.a	n.a	n.a

* Spain and Norway have reference year of 2016, the rest has reference year of 2018
**data from "Materialstrømmen til plast i Norge - Hva vet vi?"

When going one step further and taking population into consideration, PLASTEAX's records are also in agreement with our previous stress on Asian pilot's impact of plastic leakage, but one unanticipated discovery was that Cyprus, one of the European pilots, has a higher plastic leakage per capital than several of the African pilots.

In addition, the term “Recycling rate of the collected” and “Recycling rate including imports” demand special attention as well, since they could indicate “the efficiency of recycling” and “Shifting the Burden of Recycling in EPR” respectively (Soo et al., 2018).\

4.1.2 Hotspot categories

The quantifiable hotspots are displayed in the form of tables and figures, while the qualitative hotspots are summarized by characterization.

4.1.2.1 Polymer

Different Polymer types have different properties such as density, durability, and so on, which will determine their behaviors and impacts once entering the marine system (Figure 16). For example, plastic bags are often made of PS and EPS, whose relative density is about 0.95 compared with seawater, resulting in floating on the surface and influencing the marine ecosystem there (ASC, 2019). Therefore, it is necessary to trace the plastic leakage by polymer types as suggested by the Guidance.

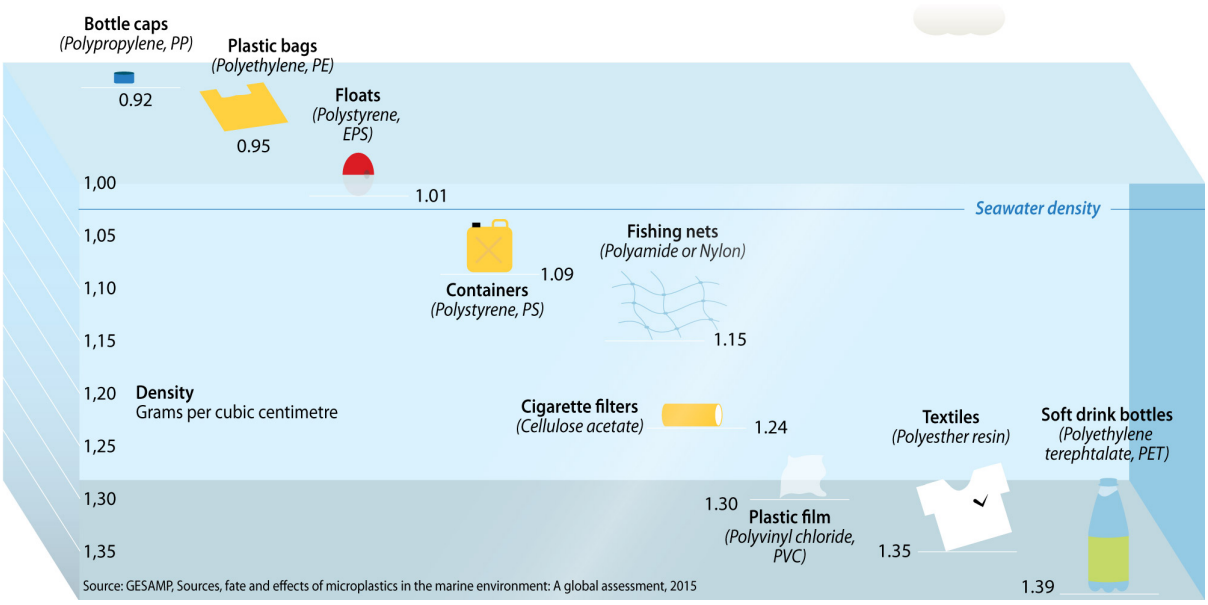

Figure 16 Plastics debris' density affecting its fate and effect (GRID-Arendal, 2016)

The pilot reports count both absolute and relative leakage rate in polymer type (Figure 17). It is observed that LDPE (Low-density polyethylene) leakage stands out from others in Vietnam, Thailand and South Africa. As suggested by its name, the density of LDPE ranges from 0.91 to 0.94 g/cm^3, plus, it is resistant to moisture, impact, and chemicals (American Chemistry Council, 2018), and hence it is widely applied in filming and packaging. The high

absolute leakage of LDPE indicates that LDPE is used abundantly and that waste collection and proper disposal for LDPE are insufficient in Vietnam and Thailand.

However, we should be aware that the absolute leakage mass is closely related to the size of the population and consumption patterns, as well as other factors. As a result, it represents the severity of the leakage unilaterally. In this case, it's meaningful to set a benchmark and compare relative leakage rate.

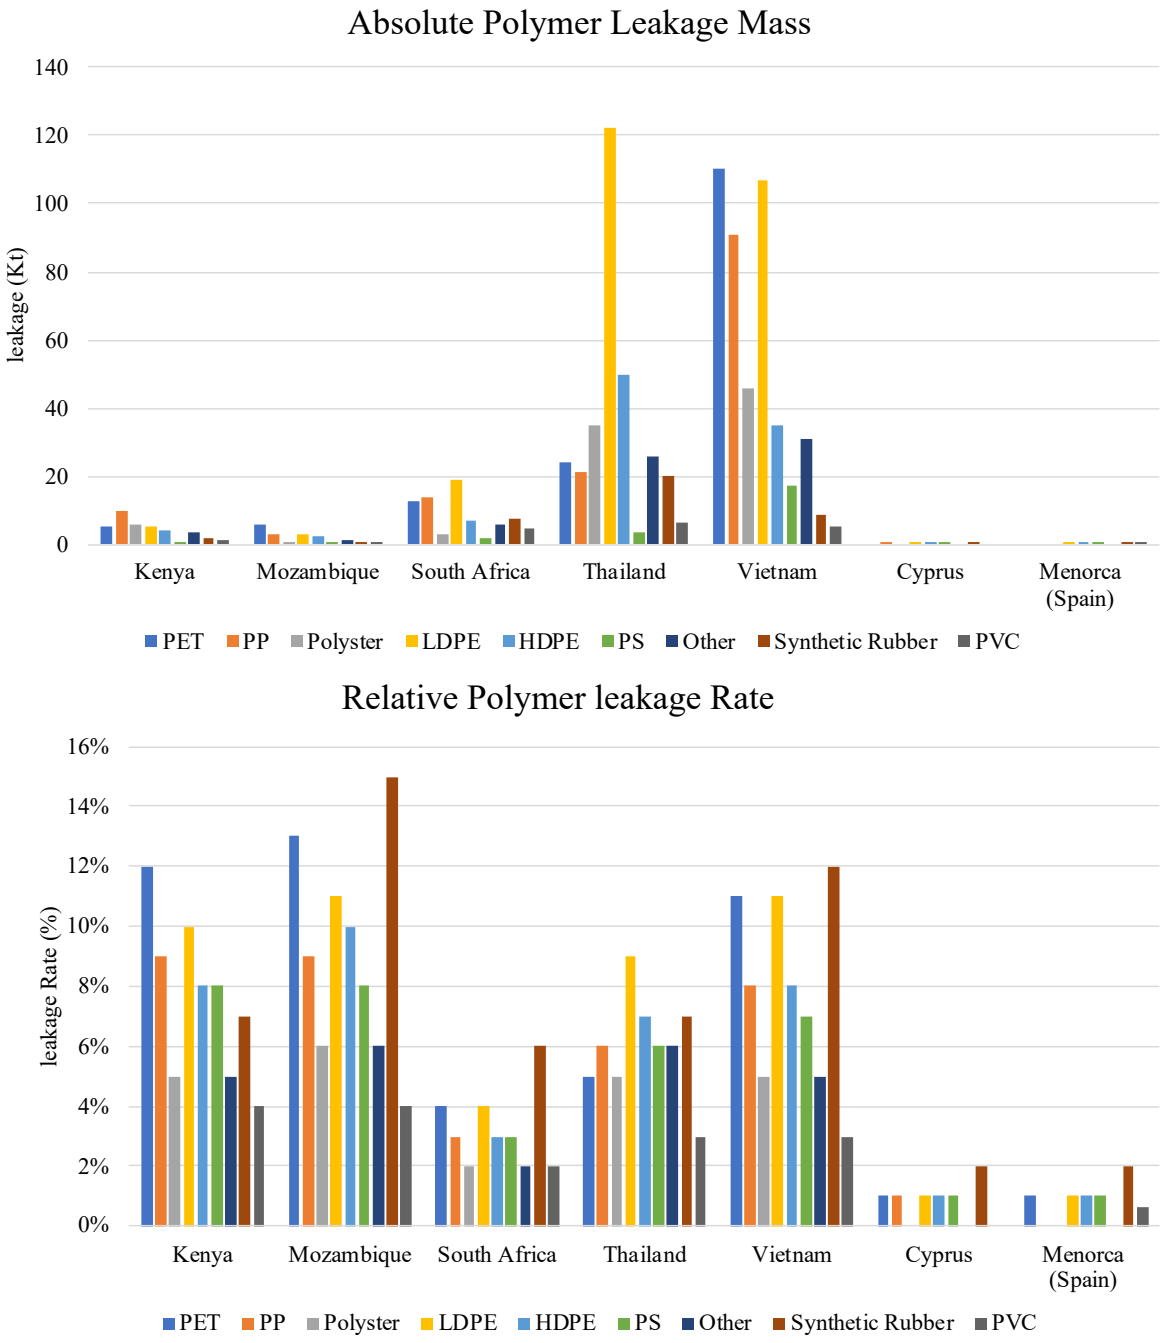

Figure 17 Polymer leakage of pilots

In terms of relative leakage rate, the overall leakage rate of polymers in Mozambique, Kenya and Vietnam is high, which may indicate that there are systemic defects and plenty of room for improvement in their plastic management and treatment processes. In contrast, although South Africa is also a developing country, its overall polymer leakage rate is closer to that of European pilots, which suggests that there are some transferable experiences to learn from.

4.1.2.2 Application

To better function, plastics deployed in different applications are often shaped accordingly, making their behaviors not the same once they entered the oceans. Fishing nets mostly result in entanglement of marine animals whereas plastic films are more likely to be ingested due to their similar appearance to jellyfish (Laist, 1997).

Gaining better knowledge on the application leakage origin could benefit not only to develop specific strategy to control the leakage (for example, deposit return scheme to recycle PET bottles) but also to form the actions purposefully to alleviate the damage they cause in the marine ecosystem (for example, 'Fishing for Litter' project and 'Ghost-fishing retrieve' plan).

In the pilot repots, origin of plastics debris by application is ranked by both absolute and relative leakage, the top 3 ones are identified as hotspots (Table 7). The applications types chosen in the Guidance cover most of short-lived products.

During hotspotting, "Other packaging" are not included in the rank of Table 7, not because their amount is small, but their sources are hard to identify and classify, therefore hotspotting "Other packaging" would only contribute very little benefit to policy making.

The results show that some applications have surprising wide influence in both absolute mass and relative rate ranking. In the table of absolute mass, bags, lids and caps often appear as hotspot in various countries; Cigarette filter is almost recognized as relative leakage hotspot for every country. Bags, lids and caps, baby diapers exist in both absolute and relative table, which could be the consequence of being small objects and not readily noticeable disposal.

Although hotspots are close in terms of application types, the order of application ranking among countries is not the same. The reason behind this phenomenon may still be mainly related to the national conditions. For example, Vietnam has a much longer coastline than Thailand, the fishery is relatively more developed there, and the relative leakage of fishing nets is more obvious in Vietnam.

Table 7 Application leakage of pilot

Continent	Pilot	Application leakage mass (kt)			
Africa	Kenya	Other bottles 5,4	Lids and caps 3,1	Dairy packing 2,4	
	Mozambique	Bags 4,9	Baby diapers 1,6	Other bottles 0,9	
	South Africa	Bottles-PET 8	Baby diapers 2,5	Food containers-PS 1	Cigarette filters 1
Asia	Thailand	Bags 113	Snacks Bags/Pouches 21	Trays/Boxes/Cups 11	
	Vietnam	Bags 244	Lids and caps 18	Boxes,cases, crates 17	
Europe	Cyprus	Bags 0,107	Lids and caps 0,106	Fishing nets 0,084	
	Menorca (Spain)	N.A N.A	N.A N.A	N.A N.A	

the ranking doesn't count Other packaging

Continent	Pilot	Application leakage rate (2018)			
Africa	Kenya	Cigarette filters 22%	Bags 20%	Baby diapers 14%	Sanitray towels 14%
	Mozambique	Cigarette filters 21%	Bags 20%	Baby diapers 13%	Sanitray towels 13%
	South Africa	Cigarette filters 0,19	Snacks 0,12	Fishing nets 0,12	
Asia	Thailand	Cigarette filters 12%	Baby diapers 12%	Bags 11%	Snacks Bags/Pouches 11%
	Vietnam	Fishing nets 15%	Bags 12%	Lids and caps 11%	
Europe	Cyprus	Fishing nets 16%	Cigarette filters 6%	Baby diapers 3%	Sanitray towels 3%
	Menorca (Spain)	N.A N.A	N.A N.A	N.A N.A	N.A N.A

4.1.2.3 Sector

The top 1 absolute leakage for all the pilots is from packaging, while most of the time tires have the 2nd or 3rd biggest leakage mass in pilot countries and the next most-common sector is Textiles (Table 8). Except for European pilots, the top 2 leakage rates of Asian and African pilots are all from fishing and medical. Fishery, medical and tire are the common areas with high incidence of plastic leakage.

To a certain extent, this is linked to the selection of application hotspots. The industries with large leakage volume are often deploying short-life applications massively such like packaging and medical. Tires and textiles, although they have longer life-time, leakage occurs commonly through wear and tear.

Same principle as the hotspotting of application, the rank in Table 8 does not cover the "Others" sector, for the difficulty to trace back its origin and plan actions accordingly.

Table 8 Sector leakage of pilot

Continent	Pilot	Sector leakage mass (kt)		
Africa	Kenya	Packaging 20,3	Textiles 4,4	Automotive-tyres 2
	Mozambique	Packaging 12,9	Textiles 0,7	Automotive-tyres 0,7
	South Africa	Packaging 46	Automotive-tyres 8	Construction 4
Asia	Thailand	Packaging 166	Textiles 19	Automotive-tyres 18
	Vietnam	Packaging 317	Textiles 32	Automotive-others 10
Europe	Cyprus	Packaging 0,325	Automotive-tyres 0,167	Fishing 0,093
	Menorca (Spain)	Packaging 0,042	Tourism 0,019	Automotive-tyres 0,005

the ranking doesn't count Others

Continent	Pilot	Sector leakage rate (2018)		
Africa	Kenya	Medical 19%	Fishing 12%	Agriculture 10%
	Mozambique	Fishing 20%	Medical 19%	Automotive-tyres 15%
	South Africa	Fishing 14%	Medical 8%	Automotive-tyres 6%
Asia	Thailand	Fishing 24%	Medical 15%	Agriculture 9%
	Vietnam	Fishing 35%	Medical 18%	Automotive-tyres 12%
Europe	Cyprus	Fishing 28%	Automotive-tyres 2%	Packaging 1%
	Menorca (Spain)	Fishing 22%	Automotive-tyres 2%	Packaging 1%

4.1.2.4 Waste management

Ocean plastics debris is often the consequence of poorly-managed waste (US EPA, 2015), this fact highlights the importance of investigation and assessment of waste management. In the Guidance, waste management associated with plastic is subdivided into 32 items and their performance is graded as exacerbating hotspots, neutral spots and alleviating coolspots (Table 9). On the right of the Table 9, number of pilots scored hotspots/coolspots in certain item are counted and the top/bottom 10% on rank are shadowed with red or green according to their impacts on leakage occurrence; on the bottom of the Table 9, total numbers of hotspots/ coolspots /natural /non-assessed items of each pilot are summed.

The results show that based on the known information, Menorca has relatively advanced plastic waste management, more hotspots where leakage are likely to occur emerged in the waste management in Thailand, Kenya and Mozambique. Among the developing countries, South Africa has the fewest hotspots in waste management, which may partly explain the relatively low polymer leakage rate mentioned previously.

From each level of processes on waste management, the majority of pilots' performance on tertiary processes of “Segregation of compostable waste”, “Formal collection of municipal waste” and “Littering due to a lack of public waste bins” is poor. The numbers of coolspots in secondary processes of “waste collection" and "waste related behaviors" are the lowest, which suggests that more attention should be paid to these two.

However, it's worth pointing out that in several nations, roughly a quarter of the sections have not been evaluated. The assessment of these sections still has the chance to be graded as hotspots once adequate knowledge is accessible.

●	Not assessed	9	8	8	10	9	11	6

4.1.2.5 Region

Due to data availability and data granularity, different pilots do not use the same scale for regional hotspot analysis, which makes it hard to achieve cross-comparison.

A common pattern observed is that plastic waste generation centralize around cities, the waste collection rate and per capita plastic waste production in urban areas are also significantly higher than those in remote areas. An area with easy access to water bodies (rivers or sea) has bigger leakage volume than those without.

4.2 Case study in Norway

Following the same order as subchapter 4.1, the case study covers Norwegian national overview and hotspotting results calculated from the Guidance.

4.2.1 Overview

It is estimated that the plastics waste generated in Norway is around 540 kt in 2019, equivalent to 101 kg per capita per year. Most of the plastic in Norway is consumed for packaging, followed by tires, textiles and construction (HMF, 2021a). Consumed plastics could have the status of "in use" (the 'stock' of a MFA system in Figure 11) , or alternatively "waste".

Norwegian plastic waste system is heavily reliant on export, 80% of the plastic waste sorted for recycling is exported (SYSTEMIQ et al., 2021). According to the Norwegian company Nofir, the fishing nets collected in Norway were sent to Lithuania and Turkey for disposal and preparation for recycling (Nofir, 2017). Another Norwegian company Infinitum tells 18 kt of collected PET bottles under Deposit Return Scheme (DRS) are exported to Sweden, Germany and the Netherland for recycling annually, but those products made of reused PET frequently end up discarded and incinerated (Infinitum, 2020). Finland is also one of the receivers of collected plastic packaging waste from Norway (Grønt Punkt Norge, 2020).

Driven by growing Norwegian population and increasing waste generation per capita, the plastic waste generation is projected to grow at a rate of 1.2% per year (SYSTEMIQ et al., 2021). Consequently, the scientific management and monitoring of plastics is particularly important.

Properly managed plastics waste usually is not considered as emission. As for the plastic emitted to the Norwegian nature, a pessimistic estimation on microplastic emission gives a total volume of 45 kt in 2020 (Table 10). Note that Plastic emission to environment doesn't equal to the concept of plastic leakage as mentioned earlier: plastic leakage emphasizes on the part staying in ocean, while the emission could happen on land and not all would end up in oceans, thereby the leakage is only a fraction of plastic emissions.

Norway's most famous industries, fisheries and aquaculture, lost enormous amount of plastics to sea (ASC, 2019), but the reason this fact is not reflected in Table 10 is casued by "Allocation rule to avoid double-counting". For example, the plastics used to build fish farms are classified as "Construction", and the plastics wrapping of the fish is taken as "Packaging". Only very small portion of plastics appliance in fisheries and aquaculture, such like commercial fishing net and feeding pipes, can be certainly allocated back to these 2 sectors.

Table 10 Estimated Norwegian microplastic emissions in 2020

	Source	Pessimistic (ton)	Optimistic (ton)	Most-likely (ton)
Land base*	Car traffic	10780	4880	8325

Data:	*Report 'Norske landbaserte kilder til mikroplast'			
	**Report 'Sea-based sources of microplastics to the Norwegian marine environment'			

A survey about Norwegian marine litter indicates that plastic leakage from fisheries and aquaculture sectors weights around half, that is the highest ratio among all type of marine litter sampled from 50 beach cleanup sites; meanwhile HDPE is in the first place in terms of polymer weight (Table 11). The origin of around 10% of marine plastic waste collected can be identified, with more than 70% of these identifiable objects traced back to Norway.

Table 11 Key findings from beach cleanup along Norwegian coast (Mepex & Miljødirektoratet, 2020)

Most found Item by weight	Percentage (%)	Polymer type of found plastic	Percentage by weight (%)
Rope	20,9	HDPE	62,3

Reinforcing fiber	3,5		
Strapping bands	2,1		

The general idea behind hotspotting methods of polymers/applications/sectors presented in the Guidance can be shortly described as coherent matrix: data on plastic flows in polymers/applications/sectors processed with the information on the waste front such like littering rate/recycling rate and so on, then the leakage is simulated based on the principle of mass balance.

Following the Guidance, the biggest bottleneck lies on the plastic waste system, very limited information is known on the waste side, for instance, domestic recycling of collected polymers, littering rate for applications, and so on are not publicly available. Lacking these crucial parameters making the completion of full hotspotting impossible. However, the coherent matrix deployed in the Guidance makes the estimated plastic net inflows and hotspotting in certain aspect feasible. Net inflows here are defined as "the difference between import and export", a positive value suggests an increasing in the Norwegian plastic stock

Polymers/applications/sectors hotspotting is gained through Tool 1.4 while the impact matrix is completed with Tool 6.1. Many findings in Norway demonstrate similar trend as the published pilot reports, more results and detailed discussions are presented in the sections below.

4.2.2. Norwegian hotspotting

With high feasibility of Tool 1, Tool 2 and Tool 6 (hereinafter Tool abbreviated as T), the status of Norway's plastic leakage is explored. Other existing studies are introduced to interpret the findings.

4.2.2.1 Polymer Type

Based on the Norwegian external trade in goods of 2018 provided by Statistics Norway, different polymers are aggregated to build the estimation of their own net inflows (Figure 18). Among the 8 polymers the Guidance focuses on, High Density Polyethylene (HDPE) has significant high volume, followed by Polystyrene (PS), Synthetic Rubber (SR) and other plastics.

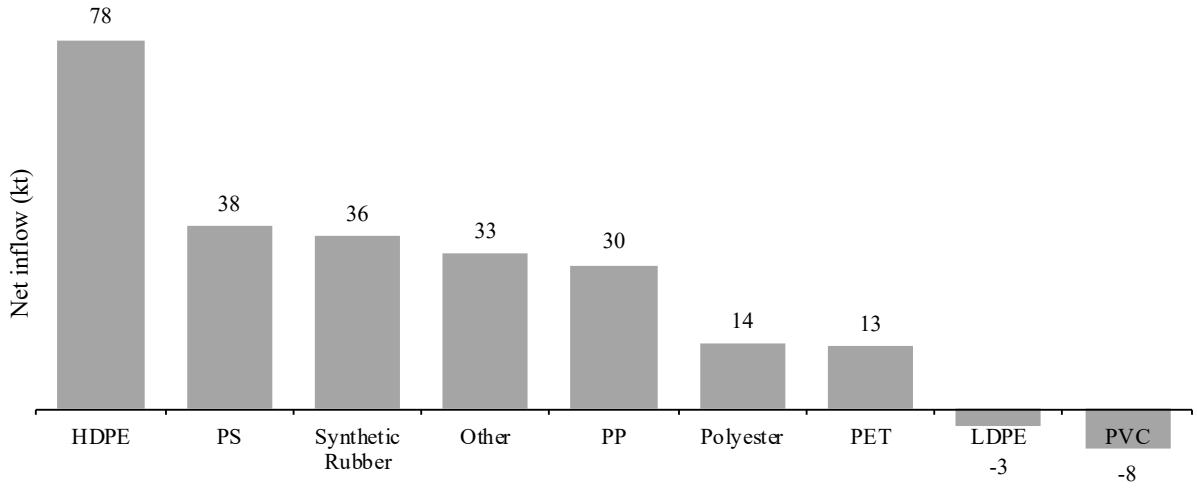

Figure 18 Net inflow downward ranking by polymer

Despite the fact that the results only show the net inflows to Norway, it is crucial to highlight that such a vast volume of HDPE would intimately turn into waste once it reached the end of lifetime, which could add pressure to the waste system. In Norway, HDPE is also widely deployed in fisheries and aquaculture, such like floating cages and pipes (NIVA & Miljødirektoratet, 2021). Fortunately, HDPE is recyclable and nowadays being recycled, it is commonly used in durable plastic water bottles, toys, chemical containers and pipes.

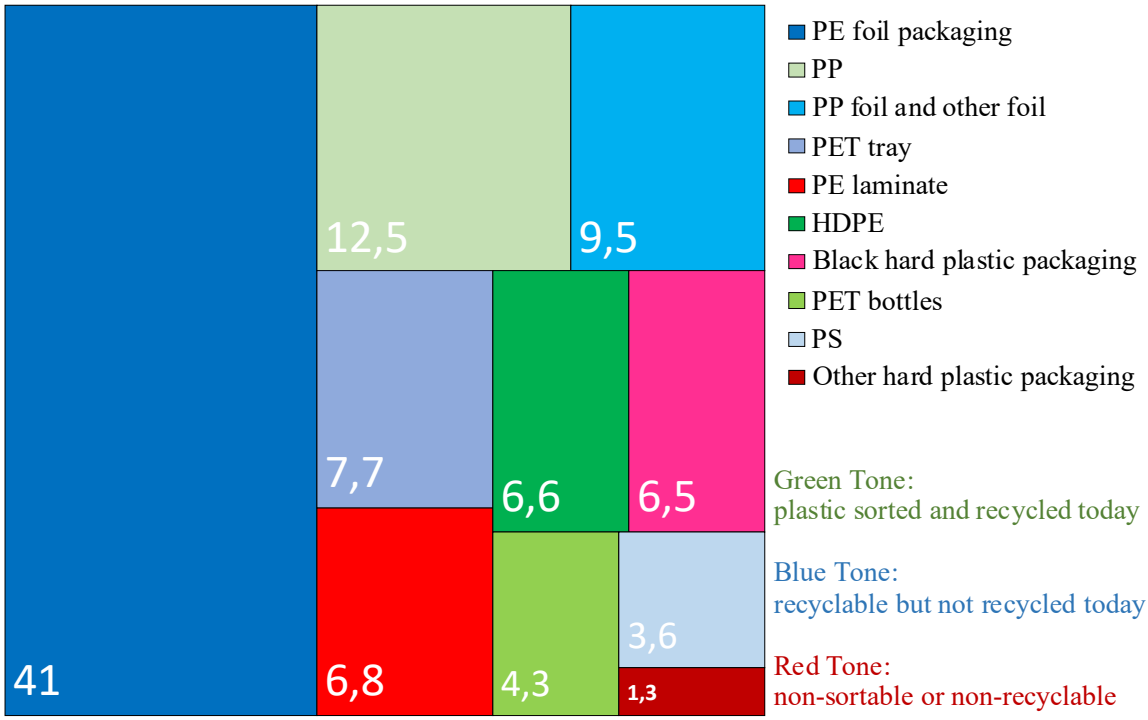

Figure 19 Weight percentage composition of Norwegian household plastic waste (Mepex & HMF, 2020)

It's worth noting that the estimate is based on a nationwide scale, taking into account all activities happening related to Norway, and the 'net inflow' is not equivalent to the concept 'plastic waste', which emphasizing on plastic after consumption/use. However, it is interesting to compare the result with polymers' contribution on the waste front. According to a study about Norwegian household plastic waste, PE foil is dominant with a total of 41% (Figure 19) while the HDPE is only taking 4.3%. The difference between the results given by the Guidance's method and the other report may be led by the following factors:

- Various polymers products are consumed at different ratio on a household and a national level.

  E.g. HDPE feeding pipe used in salmon farming usually won't show up in the household waste.

- The polymers' fates vary after consumption according to their function.

  E.g. The fate can vary for different polymers, PET bottles for convenience-sized beverages often have shorter lifetime than HDPE bottles for shampoo, and even the same polymer, the fate could also vary such like PVC drainage pipes have longer lifetime than PVC disposable gloves.

From the perspective of plastic leakage, Table 11 addresses that the HDPE is the most found polymer in terms of weight, which can be linked to the result given by the Guidance, laying the stress on necessity of special attention on waste management and leakage prevention of polymer HDPE.

4.2.2.2 Application

Plastics net influx entering Norway in 2018 are mapped to different applications categories with a full list of 65 items (see appendix Table 17), the top 10 contributors are illustrated below where the bags, new tires, other packaging ranked the top 3 (Figure 20). The results suggest great coherence with the net inflow estimation by polymers, as HDPE, PS are commonly consumed in packaging while the Synthetic Rubber (SR) is a common ingredient for car tires.

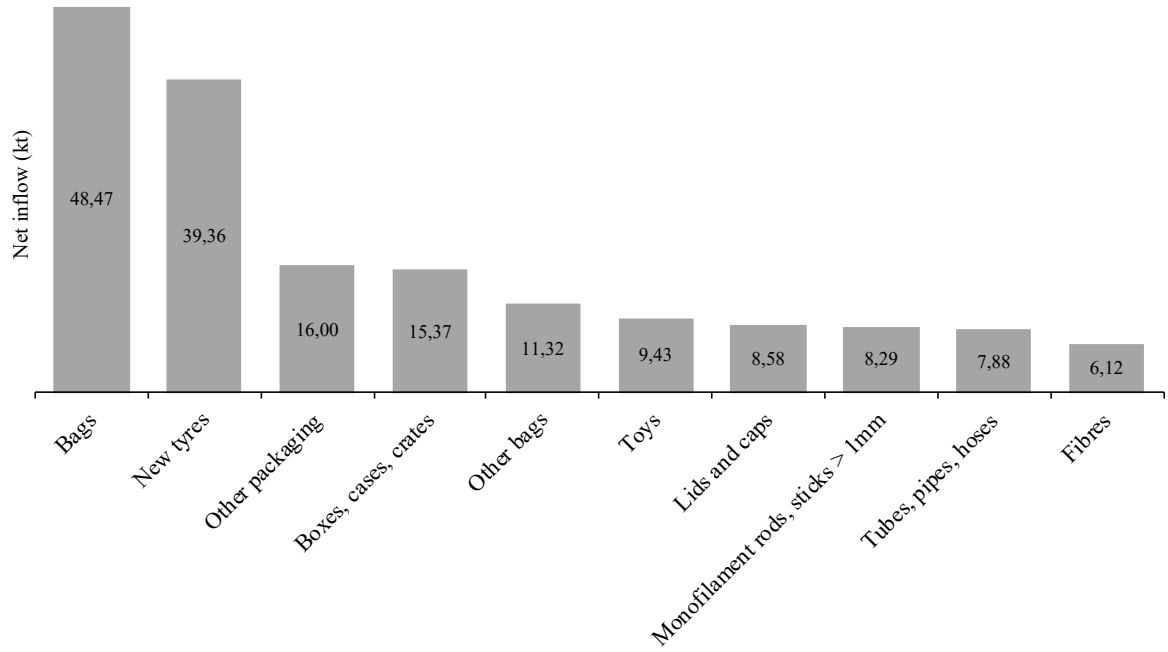

Figure 20 Net inflow downward ranking by application (top 10)

Among the top 10 appliances, the new tires draw attention. Not following the same pathway to the nature as packaging product, plastics from tires wear into small pieces and dusts spreading into the environment when driving (Miljødirektoratet & Mepex, 2021). In addition, the fibers and pipes also show up in the top 10 list. An increasing proportion of textiles are wholly or partly based on micro-thin plastic fibers; during use and washing, clothing, furniture and other textile-based products release microplastic fibers to both air and water (Miljødirektoratet & Mepex, 2021). A huge ratio of synthetic textile fibers is captured in sewage treatment plants but it is then spread further with the sludge used for soil improvement and brought back to water by runoffs. As for tubes and pipes, a considerable part of the plastic debris they emit originate from weathering or wear of plastics. Tires, pipes, and Fibers' unique potential pathways set them worrisome because of the difficulties in collecting and managing their debris in the waste system (Mepex & Miljødirektoratet, 2014).

Among the previous researches, a report calculates the percentage of plastic waste generated by applications from different industries (Mepex & HMF, 2020). Due to disparate scope and targets, there are discrepancies between the application classification standards adopted in this report and the Guidance (Figure 21). Although the classification standards used by the two are not the same, the similarity of the results can still be observed. In the plastic waste generated by the application of various industries, packaging, tires and textile fibers still

occupy relatively high ratios, which is similar to net inflow order given by the Guidance. Meanwhile, another report on land-based plastic emission to Norwegian nature underlines the volume of traffic vehicles and textiles can not be ignored (Miljødirektoratet & Mepex, 2021). Last but not the least, as the leakage descripted in Table 11, Food and drink packaging, Textiles and Car parts happen to be the top 3 most found item, suggesting immediate intervention in these three types of applications is urgently needed.

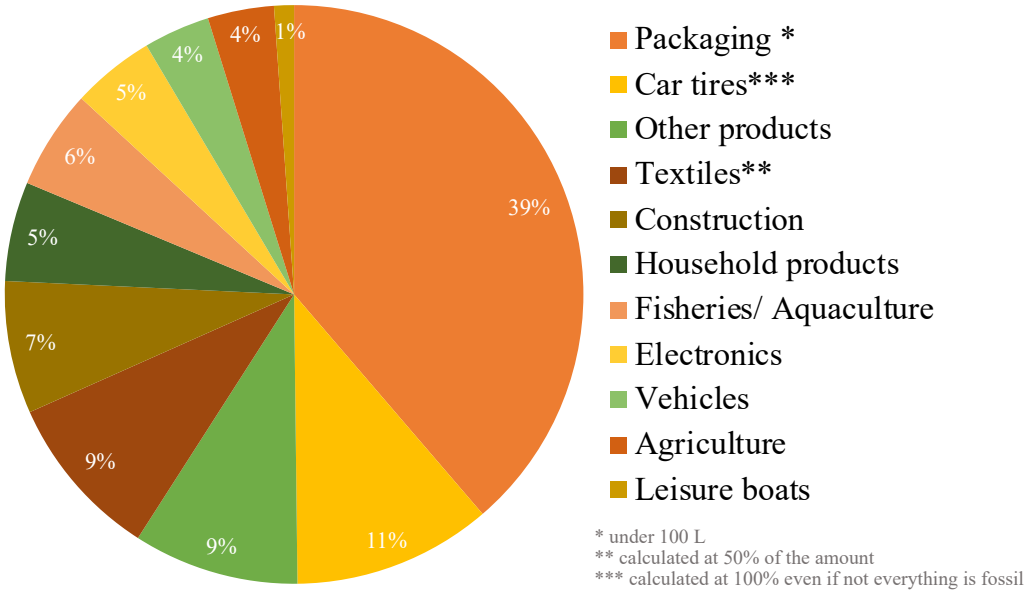

Figure 21 Estimated share of applications' plastic waste (Mepex & HMF, 2020)

It should be always emphasized that the estimates given by the Guidance are not plastic waste, plastic emission nor plastic leakage, but the net inflow adding to Norwegian MFA system. However, the similar trend of the four studies focusing on Norway which are conducted with different data basis and hence validate each other: the results generated by the Guidance's method in this thesis, Norwegian plastic waste generation (Figure 21), Norwegian microplastic emission (Table 10) and Norwegian marine litter found in beach cleanup (Table 11), shows that the adoption of the Guidance could assemble instructive and transferable knowledge in the Norwegian context. Car tires, packaging and textiles should be the key application objects to manage plastic and monitor plastic leakage.

4.2.2.3 Sector

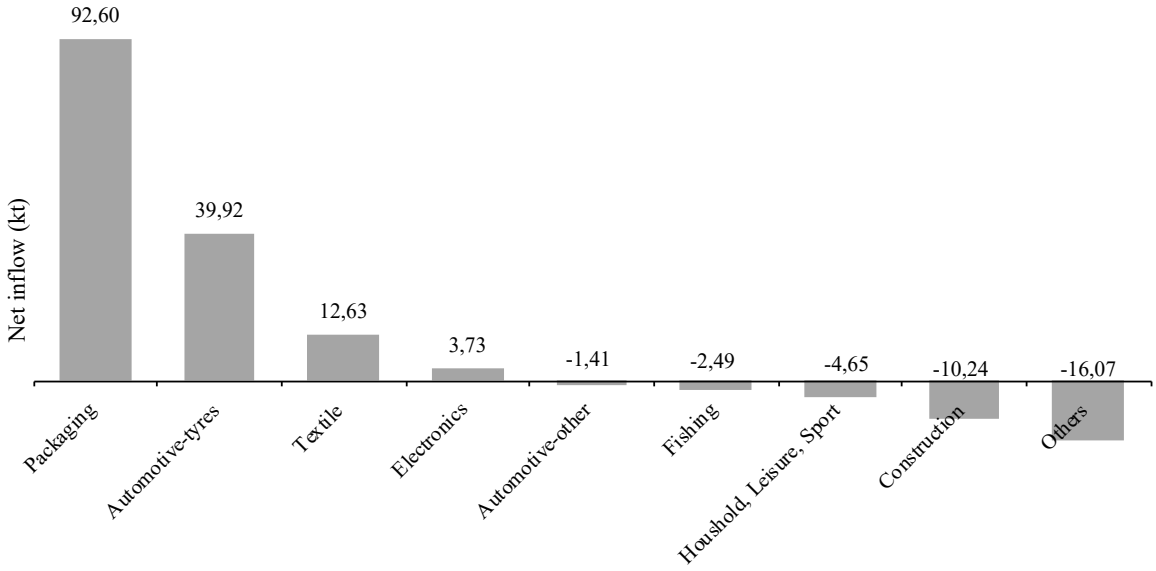

Figure 22 Net inflow downward ranking by sectors

The net input of Norwegian plastics in 2018 can also be broken down according to the sectors where the plastics are/will be needed. Although definitions of some sectors vary slightly in the published pilots' reports, the Guidance primarily examines 11 industries of which data on medical, and agriculture are temporarily unavailable in the Norwegian context (Leisure in Figure 22 is regarded as equivalent to Tourism). The results given in the Guidance still have great value for comparison with the report issued by Mepex & Handelens Miljøfond in 2020, both highlight the big contribution of packaging, tires and textiles to the plastics flows.

Realizing the heavy impacts of plastic packaging, Norway aims to consume 50% fewer plastic bags by 2025, banning single-use bags has made a difference, people are more likely to choose reusable and recyclable packaging (Tiller, 2021). Coca-Cola in Norway has also followed this change and launched the "Pant meg igjen / Return me again" drinks, whose packaging is entirely made of recycled PET (Coca-Cola Norge, 2021). Although it is gratifying to see the efforts of the packaging industry to fight against plastic waste, it is particularly noteworthy that while the recycling rate of plastic materials in the packaging industry has exceeded 20% nowadays, a considerable part of it is achieved through the Deposit Return Scheme (DRS) of PET bottles. In reality, PET bottles only account for less than 10% of the entire packaging industry and recycled plastics counts less than 9% in material input for production (Mepex & HMF, 2020), which makes the recyclability of plastic waste systems in other industries in Norway questionable.

In terms of plastic waste emissions from differing sectors, although there are currently no comprehensive studies at the Norwegian national scale, some researches manage to enlighten the situation of plastic waste in specific industries. Predominately contributed by Abandoned, Lost or Discarded Fishing Gears (ALDFG), a study investigating plastic martial flow in Norwegian fisheries compute an annual leakage to oceans of 0.308 kt (Deshpande et al., 2020). Another report also highlights the fishing and aquaculture contributed most weight in the marine litter found in Norway (Mepex & Miljødirektoratet, 2020). In other sectors, Norwegian plastic waste from household and packaging revealed 72% of plastics collected from these sectors are ultimately incinerated (Figure 23), leaving only 25% sent to material recycle, and less than 2% (approximately 2 kt today) may face the fate of being disposed of in unsanitary landfills, leaked to waterbodies or burnt openly according to the data from 2019 (SYSTEMIQ et al., 2021).

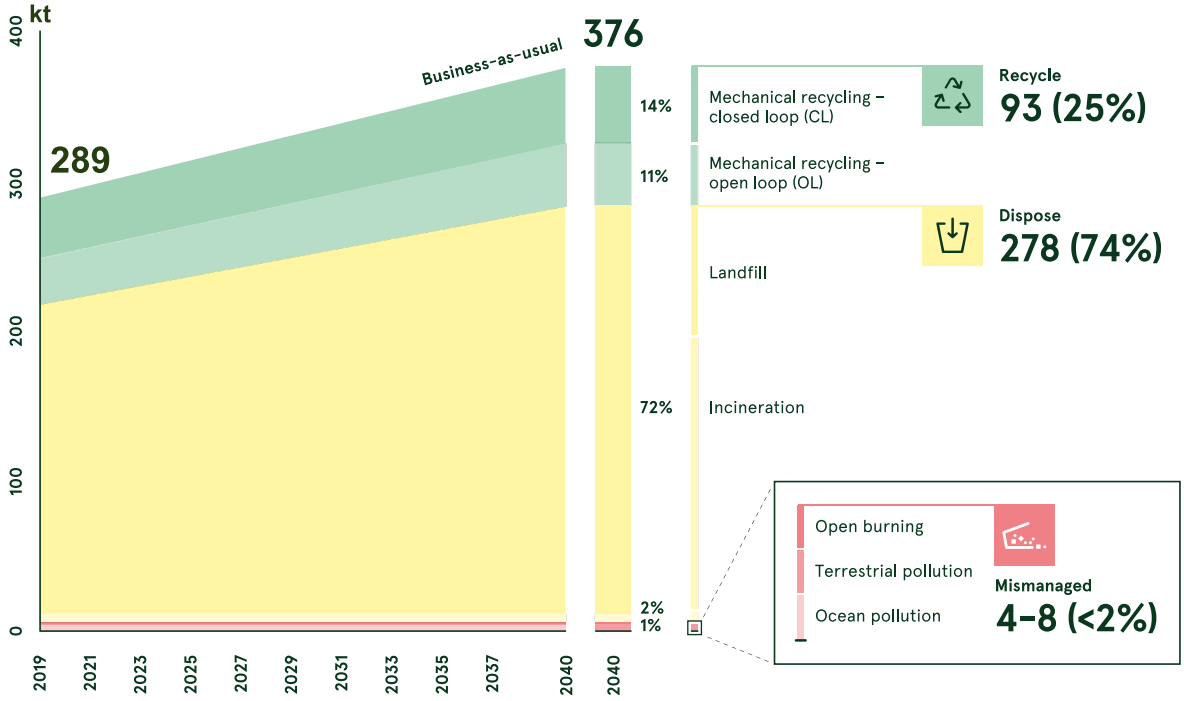

Figure 23 Projection of plastic waste from household and packaging under business-as-usual (SYSTEMIQ et al., 2021)

Except for fisheries and aquaculture, the order of plastic input is basically the same with that of leakage in other industries concluded from beach cleanup, the possible reasons for the differences are as follows:

- Sector allocation:

  E.g. plastics used to pack up seafood may not be counted as in fisheries and aquaculture but in packaging, the buoys equipped in fish farm may be sorted as construction.

- Relevance of plastic leakage in different sectors

  E.g. Fishery and aquaculture are in direct contact with the water body, and the plastic debris formed can directly enter the ocean, therefore these sectors are highly relevant to plastic leakage. The relevance of plastic leakage in electronic and electrical industry can be relatively low because its application won't have direct contact with water under normal condition.

- Plastic waste exported

  E.g. As mentioned earlier, the plastic waste from Norwegian fisheries and aquaculture was exported (Nofir, 2017), the exported volume was detected when calculating the net inflows.

Considering the above reasons at the same time: the plastic input of fishery and aquaculture is underestimated due to sector allocation principle, plastic waste is exported abroad, and fishery and aquaculture are highly relevant to plastic leakage. The combined effect of these factors leads to the difference of their behaviors differentiate in net inflow and marine litter.

4.2.2.4 Impact assessment matrix

Unlike the hotspotting method mentioned above, the environmental impact matrix of plastics in Norwegian waters uses the data from beach cleanup. More specifically, tool 6.1 uses *Ocean Trash Index* published by Ocean Conservancy (Ocean Conservancy, 2021). The estimation of fishing nets varies according to the situation of each country/region (see appendix Table 21 and Figure 25). The mechanism of this evaluation matrix lies in that the impact scores are obtained by allocating the level of severity (high, medium/unknown and low) in each aspect of plastic applicants on terms of Fate, Exposure and Effect.

The scores show that under the simulation given by the current guidance, the issue of bags, boxes, cases and crates in ocean plastic should be given the priority (Table 12).

Table 12 Plastic application's impact matrix

Application	Impact Score	Hotspot
Lids and caps	7	not considered
Other packaging	5	not considered
Bags	9	hotspot
Cigarette filters	6	not considered
Fishing nets	5	not considered
Drinks bottles + Other bottles	6	not considered
Dairy packaging	5	not considered
Boxes, cases, crates	8	hotspot
Sanitary towels	6	not considered
Baby diapers	5	not considered

The default attached data of tool 6.1 comes from the database of ocean conservation in 2017, the lagging in time may lead to the error of the predicted impact scores. However, the applications with higher impact scores (7,8,9) are more centering at the packaging industry, ringing the bell that the management in this sector still needs to be strengthened.

5. Conclusion and limitation

Conclusions from pilots comparison and Norwegian case study are demonstrated, limitations of the method and implement of the Guidance are discussed.

5.1 Conclusion

The findings are summarized here.

5.1.1 Accomplished pilot project

- Polymers

  LDPE, synthetic rubber, and PET have high level of leakage rate in majority of pilots.

- Applications

  Bags, lids and caps, baby diapers and cigarette filters are common hotspots.

- Sectors

  Packaging, textiles and automotive-tires are most worrying hotspots.

- Waste management

  Tertiary processes of “Segregation of compostable waste”, “Formal collection of municipal waste” and “Littering due to a lack of public waste bins”, secondary processes of “Waste collection” and "Waste related behaviors" call for more attentions.

- Region

  Urban areas usually have the characteristics of high plastic waste production per capital, high leakage, high waste collected rate and waste generation centralized, while waterfronts have greater leakage volume.

5.1.2 Developing pilot in Norway

- Polymers

  HDPE, PS and synthetic rubber contributed the largest plastics net inflows to Norway. HDPE and PS also weight most in Norwegian marine plastic waste found, more investment is needed in the management and monitoring of these polymers.

- Applications

  Bags and new tires are the top 2 net plastic inflows, the top 10 applications are mostly packaging applications.

- Sectors

Similar with pilots, special emphasis should be paid to Norwegian packaging, automotive-tire, and textile sectors.

- Applicants' impact

Bags, boxes, cases and crates in Norwegian seas are concerning impacts hotspots.

5.2 Limitation

The limitation of the Guidance and restrictions affecting implement are elaborated.

5.2.1 The Guidance

- Assumptions and simplification

For the analysis to be as much detailed as possible but not overly complicated, many assumptions and simplifications are introduced into the Guidance. For example, the guide believes that "properly disposed plastic waste" in a sanitary landfill will not have leakage, but in reality, leachate is almost inevitable in every single landfill (El-Fadel et al., 2003).

Moreover, many conditions that vary from country to country cannot be reflected in the results of the Guidance, such as lifestyle (per capita plastic consumption/ waste generation), role in the plastic industry chain (plastic waste exporter / importer), public awareness, etc. Assumption and simplification are mostly established on homogeneity, yet the heterogeneity of each object has not been adequately emphasized

- Data coherence

As mentioned earlier, the method developed by the Guidance is heavily dependent on national trade data to derivative estimates of plastic flows. The matrix are mapped through the allocation: plastics products are categorized to polymers, applications and sectors based on the certain properties. For example, Filaments (HS code 540610) is assigned as *'Application (Product Type), Polyester (Polymer), Filament (Application), Textile (Sector)'* and its volume will be added to the input of Textile Sector. Polyethers; in primary forms, excluding polyacetals (HS code 390720) is *'Primary (Product Type), Other (Polymer), None (Application), General (Sector)'* hence the statistics of Other polymer include its value. Properties and assignments of more Trade products can be found in the appendix. This method undoubtedly ensures the consistency of the results, but consequently the data deviation is transferred in different level of aggregation.

- Database availability

Tool 1.4 plays an extremely important and irreplaceable role in the Guidance's technical stream, bridging the data gap exposed by previous studies. However, the 'UN Comtrade Database (https://comtrade.un.org/db/mr/rfGlossaryList.aspx)' deployed in the Tool 1.4 is only open for premium users instead of publicly available. The threshold of the availability UN Comtrade Database will undoubtedly lift the difficulty of widely implementing the guidelines in more countries and regions. In the case study of Norway, national trade data were fortunately extracted from Statistics Norway (https://www.ssb.no/)

- Index: absolute mass VS relative rate

Absolute leakage mass and relative leakage rate are equally considered when hotspotting. Nonetheless, in 3rd chapter Action Shaping in many pilot reports, despite of the fact medical waste has a high leakage rate, but the action suggestions in the report often do not further take the initiative in this front because of the small absolute leakage mass. Unfortunately, under the shadow of the COVID-19 pandemic today, plastic waste from the medical industry shows more worrying environment and public health consequences: plastic waste from disposable gloves and face masks carrying microbial can spread contamination in addition to entanglement of animals (Flint, 2020). The gap between rapidly changing reality and action shaping founded on index chosen could be a deficiency of the Guidance.

- Allocation rule to avoid double-counting

The method in the Guidance only classifies the trade data in a single dimension (for example, a product can only be classified into the industry where h it is mainly used), the advantage is to prevent "double counting", but meanwhile the disadvantage t that the plastic flow in some categories is transferred also exist. As mentioned earlier, the plastics used to build fish farms are seen as 'construction' rather than 'fisheries' for example

5.2.2 Knowledge and data gap

- Complex life-cycle of plastics

There are so many processes in the life-cycle of plastic products plus the fact that the interactions among them are complicated, that it is not easy to understand the environmental problems of plastics and carefully distinguish the subtle differences between concepts, terms are often used imprecisely and interchangeably. This thesis made attempts to identify different definitions with concept map. However, many studies do not strictly define and distinguish terms used.

In addition, the plastics industry involves a large number of stakeholders, they may be distributed all over the world, this further greatly worsens the tracking of specific material flows. In the case of Norway, the plastic waste sorted for recycling is processed in Finland, Germany, Sweden, Turkey, Lithuania and so on, the system and detailed processes occurring there are often unclear.

- Insufficient information on waste and recycle

Compared with the production and consumption of plastics, the knowledge of waste generation and treatment is relatively lacking in the picture of Norway. Municipalities and private waste hauling firms collect plastic waste. Depending on the product use or assumption made, it can be collected as a single product stream (for example, through a deposit system), a single waste stream (for example, mixed plastic sorted at source by companies or household), or mixed waste with other materials and residuals (SYSTEMIQ et al., 2021). There is no unified waste collection pattern, which makes it difficult to obtain high granularity data and information easily.

In terms of recycling, since Norway relies heavily on exports to recycle plastic materials, what happened in the foreign sorting plants remains in a black box, hence there is barely any Norwegian plastic waste study diving deep into recycling rate, recover rate and so on.

The process of plastic waste collection and treatment involves many processes and stakeholders. Insufficient information on waste and recycling is not only a problem emerging in Norway. Experts from EA also reveal in the meeting that the insufficient information has also been encountered in the implementation of many pilot projects, and EA's solution is to purchase data from consulting companies.

6. Outlook

The findings in this thesis reveal the urgent call for immediate interventions, and there is further work to be done in the future.

6.1 Plastic leakage crisis

In the global context of the continuous impact of the Covid-19 pandemic, plastic leakage has once again become an obvious and urgent environmental crisis. The prevention and control of plastic pollution is a comprehensive measure, its use, disposal, waste treatment and other aspects need more environmental-oriented intervention. for instance, in the aspect of plastic consumption and usage alternative materials such as paper, polylactic acid (PLA) and so on are worthy promoting, as well as recycled plastics are advocated to replace virgin materials.

In addition, in view of the universal occurrence of some leakage hotspots, the intervention measures should be taken in the corresponding sector, application and so on.

6.2 Implement of pilot in Norway

The biggest challenge in implementing the guidelines in the Norwegian context is “Insufficient information on waste and recycle”. Considering the workload of completing the Guidance (mainly data collection), the subordinate work of implement can be used to design master's thesis project, semester project, internship project or summer school. In a specific case, a viable semester project could focus on polymer recovery rate in Norway using the questionaries provided by the Guidance.

Alternatively, Scenarios can be sketched accordingly to bridge knowledge and data gap, fulfilling the estimation through simulation. In this aspect, the “Plastsimulator (https://handelensmiljofond.no/plastsimulator)” built by the Norwegian Retailers' Environment Fund offers a nice example (Figure 24).

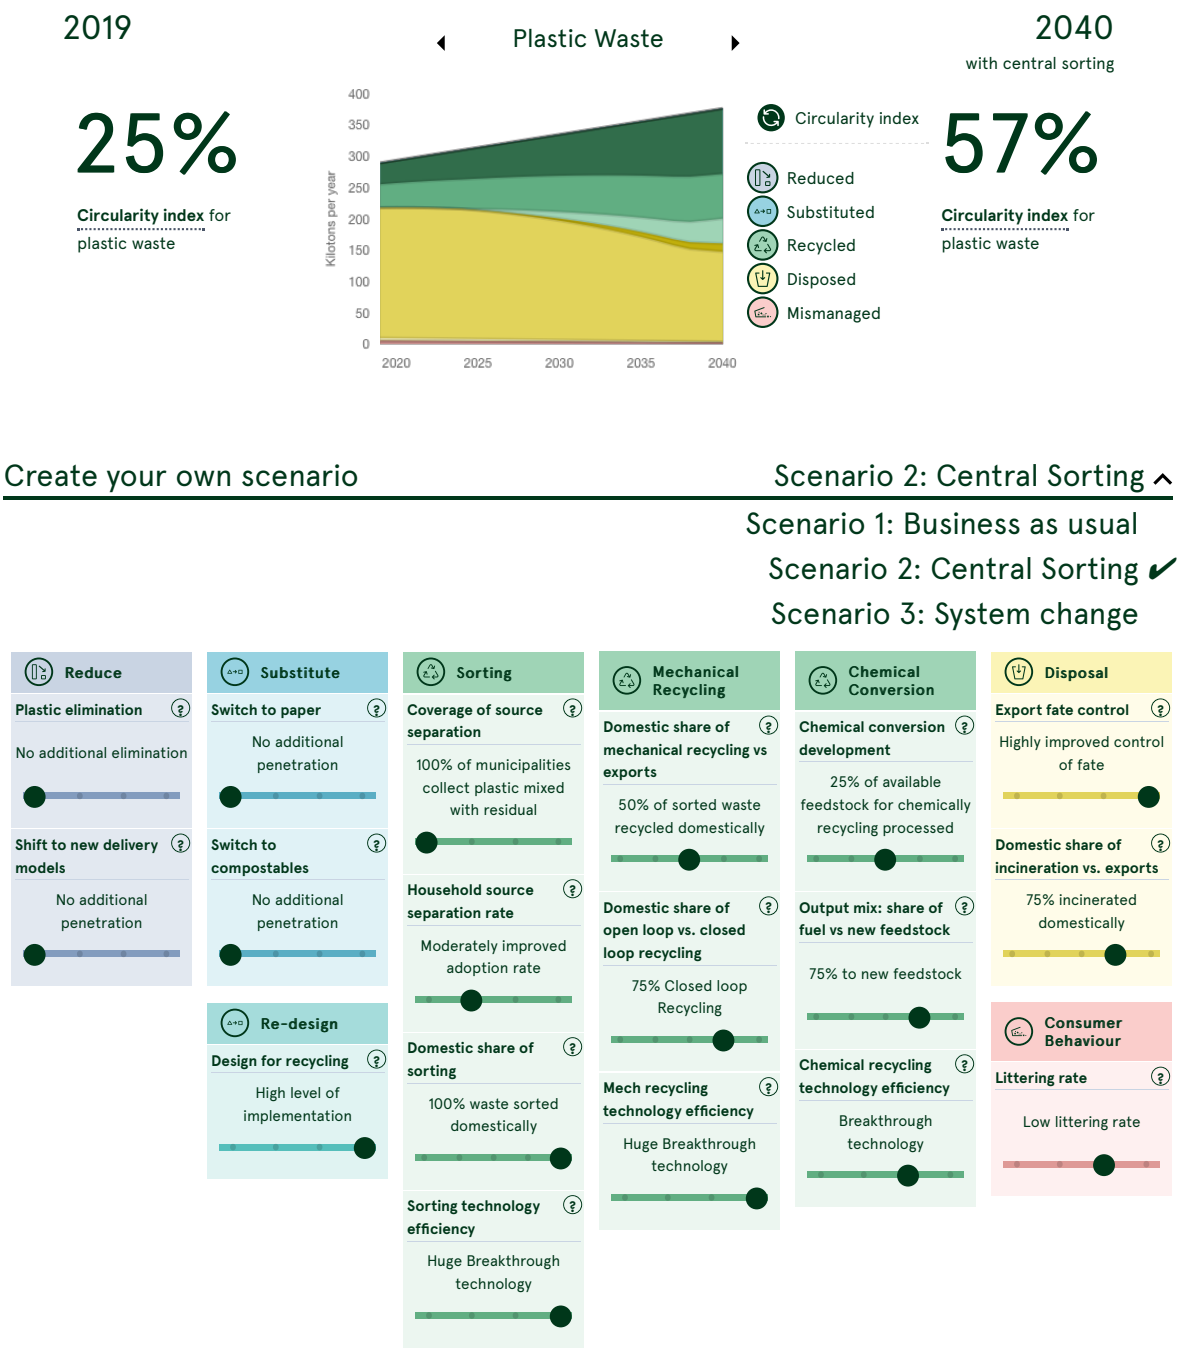

Figure 24 Parameters of scenarios in Plastsimulator(HMF, 2021b)

Table 21 Overboard plastic littering by Norweigan fishermen in 2018

Item	Volume	Reference
Number of boats	5295	(Fiskeridirektoratet, 2020)
Number of fishermen	11219	(Statistics Norway, 2021b)
Mean number of fishermen per boat	2.12	
Number of days at sea	130	(Skatteetaten, 2021)
Total population (capita)	5295619	(Statistics Norway, 2021a)
Packaging littered (kt)	35	(Strøm, 2017)
Littering rate (kg/cap/day)	0.0362	
Average plastic waste littered overboard (tonnes)	52.8	

Note:

Finishing net (Item 9 in Tool 6.1 assessment matrix)
= Plastic gears direct leakage calculation + average plastic waste littered overboard
= 380 t (Deshpande et al., 2020) + 52.8 t (Tool 3.1 Sheet 2)
= 432.8 t

Other items in the assessment matrix use coastal cleanup data from Ocean Conservancy(Figure 25), which is attached to the sheet "Ocean_Conservancy_database" in Tool 6.1 excel file.

Figure 25 T6.1 Norwegian environmental impact matrix calculation

TOOL T6.1 — MARINE PLASTIC ENVIRONMENTAL IMPACT ASSESSMENT MATRIX

NORWAY

STEP 1 — Fate & Exposure

Qualitative assessment of the probability of marine organisms to be in contact (exposure) with the plastic from a given plastic application. Step 1 includes 4 criteria : 1.1 –> 1.4 as listed below. Each of these criteria is assessed using a 3 level notation.

STEP 2 — Effect

Qualitative assessment of the potential effects that the application may have on marine organisms. Includes

			1.1 Frequency of Occurrence	1.2 Initial number of pieces/kg	1.3 Buoyancy (g/cm3)	1.4 Expected Degradation Rate (year $^{-1}$)	2.1 Potential impact
	Supporting info if available						
3 Level qualitative notation	**High**	**3**	Frequently: Fishing Net	High	≤ 0,9	More than 100 years	Frequently described as frequently causing harm such as suffocation or entanglement
	Medium (or unknown)	**2**	Occasionally: Bottle	Medium	≥ 0,9 ≤1,1	More than 1 year ; Less than 100 years	Sometimes described as frequently causing harm such as suffocation or entanglement
	Low	**1**	Rarely: Tyre Dust	Low	≥ 1,1	Less than 1 year	Never described as frequently causing harm such as suffocation or entanglement
	User Weighting		1	1	1	1	1

	Application (list to import from T3 and T4)	*number of items*						*Sum*

Meeting summary with Environmental Action (2021.April.8th)

On 2021.April.8th, an Environmental Analyst from Environmental Action who worked in the technical team of the Guidance, joined the online meeting on general information of the Guidance. The summary of the meeting minutes is recorded as below.

- Overview of the Guidance

The Guidance's method was developed as the same time of invesgativing the first pilot, which took roughly 1.5 years. At now with more focused traget and shorter version of report, a pilot's report can be ready within 2 to 3 weeks. By now 10 countries/regions have been implementing the Guidance (including unplished ones), after the long time of developing and practing, the crucial informations the Guidance needs are clear. Now the focus is more on polymer analysis and sectors, while geographical mapping is feasible if required. As for regional and waste management section which is more conceptual hence hard to quantify.

Often the case that goverments or organisations track the production of Plastics, on the contrast very rarely the organisation track the all material flows of plastics are traced, and recycling part is often missing. The Guidance tracks the first step of plastic waste, but is unclear about what happened afterwards. For instance, the waste amount in country A is known, but weather if part of waste is inported from other countru B,C,D are unclear, and will these trash stay inside of A or being further exported to E is uncertain. The chain of waste management is long and complex, making it hard to track each step.

- Past

1.The challenge of applying this guidance

The biggest challenge is data collection, especiallu recycling of the polymer type. Often countries will report their recycle rate, but it is not distigulishly stated wether it is overal recycling rate, average recycle rate, and questions also have such like 'recycle rate of what?'. PlasticEurope release reports anuually, and in their repots the problem can be spotted very obviously. For the missing data on recycling side, the data are purchased from consultancy companies.

2.The biggest advantage and disadvantage of guidance

Advantage:

It creates a complete overview of the current situation and covers wide aspects, which are cohere to each other: the polymer is cohere to sectors, and applications, and geographical, and waste.

The strongest point is there must be a balance mass between the input and output, so uncollected = input - collected. Discrepancy indicated the mis-managed/uncollected plastic waste that often is hard to estimate since required information is unknown and hard to investigate.

Disadvantage:

The Coherency in Tool 1.4 is helpful to map matrix, the sector is mapped from the polymer by knowing the selector's composition of polymer, like the polymer in which sector is used. However this pattern can be variable by country, and the Guidance only has global allocation rules. It would be more accuracy to use country-specific allocation rule. Moreover, primary plastic pattern can vary from developing country to developed country, which can be hard to remember when the UN Comtrade database is not publicly available.

- Present

1.Guidance’s role in an after-Pandemic world

Guidance can be used for a time-series comparison for a certain object. By benchmarking / baselining the case before the pandemic, the pandemic’s impact to plastic leakage can be captured: single-use plastic consumption, uncollected plastic waste, shifting between application, sector……all these results could offer reference to waste policy-makers

2. Medical leakage rasied by COVID-19 pandemeic

EA didn't really have specific data on medical waste disposal. Though typical medical plastic is small, easy to be lost, EA didn't know exactly whether the medical waste was redirected to the proper waste management or to the general mixed waste in most of the countries. Medical plastic has higher leackage rate but relative leakage rate is controversial index. Considering the total medical plastic waste amount before the COVID-19 pandemeic, it was not worthy investing too much effort in African and Asisan trying to collect more accurate data on medical waste disposal yet in Cyprus and meronaca, there is records for medical plastic, so EA is aware of its fate.

In EA's field work, syringes floating in the Kenyan canal were observed. Again, using relative leackage rate can be tricky, this may be a point worthy adjust when appplying the Guidance in the context of pandemic

- Future

An open data sharing plastform on plastic waste Plateax (https://www.plasteax.org/) is in the process of continued development and improvement, and it would work as a center of the data gathered by EA.

In the May of 2021, a new pilot report of Tanzania will be published.

Master Thesis Agreement

The Working Title for the Thesis:
This is the working title of your thesis. You will be able to set the final title when you submit your Thesis in Inspera Assessment.

National Guidance for Plastic Pollution Hotspotting and Shaping Action:
developing the pilot for Norway

Problem Description:
Problem description for the thesis. The problem description may change as you work on your thesis. This must be done in consultation with your supervisor.

Plastic pollution has become one of the most concerning environmental problems on a global scale in the past few decades, which has also received public and academic attention widely. Many studies have proven that plastic pollution is not only damaging the environment, but also posing a threat to human health. In 2010, an estimation of 4.8 to 12.7 tons of plastic had entered the oceans (Lusher et al., 2017); meanwhile the latest study points out that the total yearly microplastic intake of all humans through seafood could reach 53,864 pieces (Danopoulos Evangelos et al., 2020). Numerous facts and studies have shown that plastic pollution is in urgent need of solutions (Fadeeva & Van Berkel, 2021; Gorrasi et al., 2020; Patrício Silva et al., 2021).

As our understanding of plastic pollution gets deepened, identifying and hotspotting of plastic leakage are believed to play important roles in pollution control(Tasseron et al., 2020). In these procedures, an emerging framework is developed by the National Guidance for Plastic Pollution Hotspotting and Shaping Action (the Guidance). As a guidance constructed jointly by the United Nations Environment Programme (UNEP), the International Union for Conservation of Nature (IUCN), and the Life Cycle Initiative, the Guidance provides a wide range of models and tools to identify and hotspot plastic pollution leakages‘ location and happening reasons, which can be further presented as crucial reference to policy makers (Life Cycle Initiative, 2020).

In this thesis, the Guidance technical stream modules T1 to T6 are studied based on the pilot reports. The applicability of these modules in the Norwegian context is explored. The aim of this master thesis is to investigate the possibility of conducting such a pilot in Norway,

estimate the efforts required to do so, and to take the first steps in initiating such a pilot. Due to time constraints in the master thesis, it will be unrealistic to have a finished pilot project

Research Plan:

The following tasks are to be considered

1. Look at the reports of the completed country pilots:
    a. How did they carry the pilot project out?
    b. What data did they collect or estimate (from which sources)?
    c. What of the presented data or approaches is transferable to Norway?
2. Compare the plastic leakage from the finished country pilots with each other. Are there any lessons learnt that could be used for Norway as well?
3. For Norway specifically
    a. Investigate the data needs
    b. Identify available data
    c. Identify data gaps
4. Start conducting the pilot (modules) for Norway

Task	Start date	End date	Duration	Progress	WEEK 1 01.02.2021	WEEK 2 08.02.2021	WEEK 3 ☆ 15.02.2021	WEEK 4 22.02.2021	WEEK 5 01.03.2021	WEEK 6 ☆ 08.03.2021	WEEK 7 15.03.2021	WEEK 8 22.03.2021	WEEK 9 ☆ 29.03.2021	WEEK 10 05.04.2021	WEEK 11 12.04.2021	WEEK 12 ☆ 19.04.2021	WEEK 13 26.04.2021	WEEK 14 03.05.2021	WEEK 15 ☆ 10.05.2021	WEEK 16 17.05.2021	WEEK 17 24.05.2021	WEEK 18 ☆ 31.05.2021	WEEK 19 07.06.2021
Phase 1 Completed pilots reports reading	**2021-02-01**	**2021-03-01**	**4**																				
Draw pilot implementation processes	2021-02-01	2021-02-08	1																				
Recognize date sources and categories required	2021-02-01	2021-02-15	2																				
Compare the plastic leakage in pilots‘ countries	2021-02-08	2021-02-22	2																				
Sort approaches/lessons transferable to Norway	2021-02-15	2021-03-01	2																				
Phase 2 Norwegian context	**2021-03-01**	**2021-05-10**	**10**																				
Investigate the data needs in modules	2021-03-01	2021-03-08	1																				
Collect the available data and identify the data gaps	2021-03-08	2021-04-05	4																				
Conduct the realizable modules	2021-04-05	2021-05-03	4																				
Interpret the results	2021-05-03	2021-05-10	1																				
Phase 3 Thesis Writing	**2021-02-15**	**2021-06-07**	**16**																				
Introduction	2021-02-01	2021-03-01	4																				
Methodology	2021-03-01	2021-03-15	2																				
Results and discussion	2021-03-15	2021-05-03	7																				
Conclusion and limitation, Outlook	2021-05-03	2021-06-07	5																				

Note: ☆ Supervision Meeing Checkpoint, Thursday before next Tuesday's meeting

Main Supervisor: Francesca Verones

Co-Supervisor: Karl Klingsheim

Master Student: Fei Song
