

Dimensjonering

M30 gjengestang:

$$\begin{aligned}\gamma_{m0} &:= 1.05 & \emptyset_{nom} &:= 30 \text{ mm} & \emptyset_h &:= 39 \text{ mm} & n_{k4.8} &:= 11 \\ x &:= 1.4 \quad (\text{betong mot betong}) & \emptyset_{ekv} &:= 26.7 \text{ mm} & \emptyset_{rør} &:= 80 \text{ mm} & n_{k8.8} &:= 16\end{aligned}$$

$$f_{4.8_{yd}} := \frac{(4 \cdot 8 \cdot 10 \text{ MPa})}{\gamma_{m0}} = 304.762 \text{ MPa} \qquad f_{cd.35} := \frac{0.85}{1.5} \cdot 35 \text{ MPa} = 19.833 \text{ MPa}$$

$$f_{8.8_{yd}} := \frac{(8 \cdot 8 \cdot 10 \text{ MPa})}{\gamma_{m0}} = 609.524 \text{ MPa} \qquad f_{cd.45} := \frac{0.85}{1.5} \cdot 45 \text{ MPa} = 25.5 \text{ MPa}$$

$$f_{sd0} := \frac{355 \text{ MPa}}{\gamma_{m0}} = 338.095 \text{ MPa} \quad (\text{gjengehylse og stålrør})$$

Skjærkrefter parallelt med bjelken

Betongbrudd i hulldekke:

Utrekning med faktorer fra fib bulletin 43, i området III

$$c_{1.150} := \frac{150 \text{ mm} - 30 \text{ mm}}{2} - \frac{\emptyset_{rør}}{2} = 20 \text{ mm}$$

$$c_{1.200} := \frac{200 \text{ mm} - 30 \text{ mm}}{2} - \frac{\emptyset_{rør}}{2} = 45 \text{ mm}$$

$$\alpha_{c.150} := 0.60 + 0.233 \cdot \frac{c_{1.150}}{\emptyset_{rør}} = 0.658$$

$$\alpha_{c.200} := 0.60 + 0.233 \cdot \frac{c_{1.200}}{\emptyset_{rør}} = 0.731$$

$$V_{150_{Rd.c}} := \frac{1}{1.5} \cdot \alpha_{c.150} \cdot x \cdot \emptyset_{rør}^2 \cdot \sqrt{f_{cd.45} \cdot f_{sd0}} = 365.088 \text{ kN}$$

$$V_{200_{Rd.c}} := \frac{1}{1.5} \cdot \alpha_{c.200} \cdot x \cdot \emptyset_{rør}^2 \cdot \sqrt{f_{cd.45} \cdot f_{sd0}} = 405.472 \text{ kN}$$

Utstøping inne i stålrør:

Nonset 120 tilsvarende B35 brukes til utstøping inne i stålrøret.

$$V_{4.8_{Rd.c.120}} := x \cdot \varnothing_{nom}^2 \cdot \sqrt{f_{cd.35} \cdot f_{4.8_{yd}}} = 97.96 \text{ kN}$$

$$V_{8.8_{Rd.c.120}} := x \cdot \varnothing_{nom}^2 \cdot \sqrt{f_{cd.35} \cdot f_{8.8_{yd}}} = 138.536 \text{ kN}$$

Betongbrudd i bjelke:

Hylse til M30: *Utrekning med faktorer fra fib bulletin 43, i området III*

$$c_{1.150} := \frac{150 \text{ mm} - 30 \text{ mm}}{2} - \frac{\varnothing_h}{2} = 40.5 \text{ mm}$$

$$c_{1.200} := \frac{200 \text{ mm} - 30 \text{ mm}}{2} - \frac{\varnothing_h}{2} = 65.5 \text{ mm}$$

$$\alpha_{c.150} := 0.60 + 0.233 \cdot \frac{c_{1.150}}{\varnothing_h} = 0.842$$

$$\alpha_{c.200} := 0.60 + 0.233 \cdot \frac{c_{1.200}}{\varnothing_h} = 0.991$$

$$V_{150_{Rd.c}} := \frac{1}{1.3} \cdot \alpha_{c.150} \cdot x \cdot \varnothing_h^2 \cdot \sqrt{f_{cd.45} \cdot f_{sd0}} \cdot \sqrt{1 - \left(\frac{\varnothing_{nom}}{\varnothing_h} \right)^3} = 94.521 \text{ kN}$$

$$V_{200_{Rd.c}} := \frac{1}{1.3} \cdot \alpha_{c.200} \cdot x \cdot \varnothing_h^2 \cdot \sqrt{f_{cd.45} \cdot f_{sd0}} \cdot \sqrt{1 - \left(\frac{\varnothing_{nom}}{\varnothing_h} \right)^3} = 111.288 \text{ kN}$$

For sammenligningens skyld ser vi på kantbrudd i 150 bjelke med den empiriske og den forenklete metoden i tillegg:

Emprisk metode

$$a_2 := \frac{(150 - 30)}{2} = 60 \quad [\text{mm}] \quad \quad \quad \varnothing_{h0} := 39 \quad [\text{mm}] \quad \quad \quad h := 265 \quad [\text{mm}]$$
$$l_f := h - 30 \quad [\text{mm}]$$

$$a_1' := \frac{h}{1.5} \quad [\text{mm}]$$

$$\alpha := 0.1 \cdot \left(\frac{l_f}{a_1'} \right)^{0.5} = 0.115 \quad \quad \quad \beta := 0.1 \cdot \left(\frac{\varnothing_{h0}}{a_1'} \right)^{0.2} = 0.074$$

$$k_2 := 11.37 \quad [\text{N, mm}] \quad \quad \text{For B45}$$

$$V_{0_{Rd.c}} := k_2 \cdot \varnothing_{h0}^\alpha \cdot l_f^\beta \cdot a_1'^{1.5} = 6.099 \cdot 10^4 \quad [\text{N}]$$

$$A_{0_{c.v}} := 4.5 \cdot a_1'^2 \quad \quad A_{c.v} := 1.5 \cdot a_1' \cdot (1.5 \cdot a_1' + a_2)$$

$$V_{Rd.c} := V_{0_{Rd.c}} \cdot \left(\frac{A_{c.v}}{A_{0_{c.v}}} \right) = 3.74 \cdot 10^4$$

$$\boxed{V_{Rd.c}} := 3.74 \cdot 10^4 \quad \mathbf{N} = 37.4 \quad \mathbf{kN}$$

Forenklet metode

$$n_{s355} := 12$$

$$a_{1'} := \varnothing_h \cdot n_{s355} = 468 \text{ mm}$$

$$a_{1.vireklig} := 50.4 \text{ m} - 33.3 \text{ m} = 17.1 \text{ m}$$

$$a_2 := 60 \text{ mm}$$

$$k_a := \frac{(a_{1.vireklig} - \varnothing_h)}{n_{s355} \cdot \varnothing_h - \varnothing_h} = 39.769$$

$$k_s := \frac{(a_2 + 1.5 \cdot a_{1'})}{3 \cdot a_{1'}} = 0.543$$

$$k_s \cdot k_a = 21.584 \quad k_a \cdot k_s \leq 1 \quad \text{Altså ingen reduksjon av kapasitet for liten sidekantavstand.}$$

$$V_{Rd.c} := 1 \cdot x \cdot \varnothing_h^2 \cdot \sqrt{f_{cd.45} \cdot f_{sd0}} \cdot \sqrt{1 - \left(\frac{\varnothing_{nom}}{\varnothing_h} \right)^3} = 145.942 \text{ kN}$$

Sjærkrefter normalt på bjelken:

Betongbrudd i hulldekke:

$$a_{1.150} := \frac{150 \text{ mm} - 30 \text{ mm}}{2} - \frac{\varnothing_{rør}}{2} = 20 \text{ mm}$$

$$a_{1.200} := \frac{200 \text{ mm} - 30 \text{ mm}}{2} - \frac{\varnothing_{rør}}{2} = 45 \text{ mm}$$

$$k_{150}4.8_a := \frac{(a_{1.150} - \varnothing_{rør})}{n_{k4.8} \cdot \varnothing_{rør} - \varnothing_{rør}} = -0.075 \quad k_{150}8.8_a := \frac{(a_{1.150} - \varnothing_{rør})}{n_{k8.8} \cdot \varnothing_{rør} - \varnothing_{rør}} = -0.05$$

$$k_{200}4.8_a := \frac{(a_{1.200} - \varnothing_{rør})}{n_{k4.8} \cdot \varnothing_{rør} - \varnothing_{rør}} = -0.044 \quad k_{200}8.8_a := \frac{(a_{1.200} - \varnothing_{rør})}{n_{k8.8} \cdot \varnothing_{rør} - \varnothing_{rør}} = -0.029$$

Grunnet den store dimensjonen på stålrøret vil k_a faktoren bli negativ og går derfor ikke an å bruke. Den empiriske formelen setter en grense på $\varnothing < 60\text{mm}$ og kan heller ikke brukes.

Antar at betongens strekkapasitet ikke er tilstrekkelig. Må tas i U-bøyle.

Betongbrudd i bjelke:

$$a_{1.150} := \frac{120}{2} \text{ mm} = 60 \text{ mm}$$

$$a_{1.200} := \frac{170}{2} \text{ mm} = 85 \text{ mm}$$

$$k_{a.150} := \frac{(a_{1.150} - \varnothing_h)}{n_{s355} \cdot \varnothing_h - \varnothing_h} = 0.049$$

$$k_{a.200} := \frac{(a_{1.200} - \varnothing_h)}{n_{s355} \cdot \varnothing_h - \varnothing_h} = 0.107$$

$$V_{Rd.150} := k_{a.150} \cdot x \cdot \varnothing_h^2 \cdot \sqrt{f_{cd.45} \cdot f_{sd0}} \cdot \sqrt{1 - \left(\frac{\varnothing_{nom}}{\varnothing_h}\right)^3} = 7.144 \text{ kN}$$

$$V_{Rd.200} := k_{a.200} \cdot x \cdot \varnothing_h^2 \cdot \sqrt{f_{cd.45} \cdot f_{sd0}} \cdot \sqrt{1 - \left(\frac{\varnothing_{nom}}{\varnothing_h}\right)^3} = 15.649 \text{ kN}$$

Betongens strekkapasitet er ikke tilstrekkelig må tas i u-bøyle

U-bøylen tar all kraften og momentkapasiteten til dybelen blir begrensende blkr10:

$$e := \frac{\left(15 \text{ mm} + \frac{(1.5 \text{ } \varnothing_{nom})}{2}\right)}{2} = 18.75 \text{ mm}$$

$$M_{rd.4.8} := f4.8_{yd} \cdot \frac{\varnothing_{ekv}^3}{6} = 0.967 \text{ kN} \cdot \text{m}$$

$$M_{rd.8.8} := f8.8_{yd} \cdot \frac{\varnothing_{ekv}^3}{6} = 1.934 \text{ kN} \cdot \text{m}$$

$$V_{rd.HD.4.8} := \frac{M_{rd.4.8}}{e} = 51.563 \text{ kN}$$

$$V_{rd.HD.8.8} := \frac{M_{rd.8.8}}{e} = 103.127 \text{ kN}$$
